1 Winter semester addendum

1.0.1 Weak* convergence

Since $\mathrm{L}_\infty\Big((0,T);\mathrm{L}_2(\Omega)\Big)$ is not reflexive, we cannot extracting a convergent subsequence; however, we know the predual of $\mathrm{L}_\infty\Big((0,T);\mathrm{L}_2(\Omega)\Big)$ is reflexive, i.e.

$$\mathrm{L}_\infty\Big((0,T);\mathrm{L}_2(\Omega)\Big) \approx (\mathrm{L}_1\Big((0,T);\mathrm{L}_2(\Omega)\Big))^*,$$

which means that balls in $\mathrm{L}_\infty\Big((0,T);\mathrm{L}_2(\Omega)\Big)$ are weakly* compact. Moreover, $\mathrm{L}_1\Big((0,T);\mathrm{L}_2(\Omega)\Big)$ is *separable*, from which it follows $\mathrm{L}_\infty\Big((0,T);\mathrm{L}_2(\Omega)\Big)$ with the weak* topology is metrizable and thus there exists s weakly * converging subsequence (from the balls).

Theorem 1. *Let the assumptions of the previous theorem hold and $\Omega \in C^{1,1}, \delta \in (0,1)$. Then $u \in L_2\Big((\delta,T);\, W^{2,2}(\Omega)\Big)$.*

Proof. Take the weak formulation in $t \in (\delta,T)$. WLOG further assume $d = 0$. Then

$$\int_\Omega \mathbb{A}\nabla u \cdot \nabla\varphi = \int_\Omega f\varphi - bu\varphi - \mathbf{c}\cdot\nabla u\varphi - \int_\Omega \partial_t u\varphi = \int_\Omega (f - bu - \mathbf{c}\cdot\nabla u - \partial_t u)\varphi,$$

and the integrand of the last integral is in $\mathrm{L}_2(\Omega)$ for a.e. $t \in (\delta,T)$. We can thus use the elliptic regularity results and write:

$$\|u\|^2_{\mathrm{W}^{2,2}(\Omega)} \le C(\|f\|^2_{\mathrm{L}_2(\Omega)} + \|u\|^2_{\mathrm{W}^{1,2}(\Omega)} + \|\partial_t u\|^2_{\mathrm{L}_2(\Omega)}),$$

integrating both sides $\int_\delta^T \mathrm{d}t$ yields

$$\|u\|^2_{\mathrm{L}_2((\delta,T);\mathrm{L}_2(\Omega))} \le C(\|f\|^2_{\mathrm{L}_2(\Omega)} + \|u\|^2_{\mathrm{L}_2\big((0,T);\mathrm{W}^{1,2}(\Omega)\big)} + \|u\|^2_{\mathrm{L}_2((\delta,T);\mathrm{L}_2(\Omega))})$$

□

Theorem 2. *If data are smooth and satisfy the compatibility condiitons, then the weak solutions to the parabolic equation are smooth.*

Proof. no. □

Remark (Compatibility condition). : Take the heat equation : $\partial_t u - \triangle u = f$ at time zero: $\triangle u(0) + f(0) = \partial_t u(0) \in \mathrm{W}_0^{1,2}(\Omega)$, so we need that $f(0) + \triangle u(0)$ has zero trace $\Rightarrow$ compatibility conditions.

Theorem 3 (Uniqueness of the solution to a hyperbolic equation)**.** *Let the assumptions on the data of the hyperbolic equations be standard (i.e. minimal). Further assume that* $\mathbf{c} \in W^{1,\infty}(\Omega)$*. Then the weak solution to the hyperbolic equation is unique.*

Proof. It is enough that if $u_0 = 0, u_1 = 0 \Rightarrow u = 0 \in Q_T$. To do that, take the weak equation, multiply it by $\varphi \in V$ fixed and integrate in time and space:

$$< \partial_t u(t), \varphi > + \int_\Omega \int_0^t \mathbb{A}(s) \nabla u(s) \nabla \varphi \, \mathrm{d}s + \int_\Omega \int_0^t (bu(s) + \mathbf{c} \cdot \nabla u(s))\varphi - \int_\Omega \int_0^t u(s)\mathbf{d}(s) \cdot \nabla \varphi = 0,$$

next take $\varphi = u(t)$ as a test function and integrate $\int_0^\tau \mathrm{d}t \,, \tau \in (0,T)$. The duality term becomes

$$\int_0^\tau \frac{1}{2} \partial_t \| u(t) \|^2_{\mathrm{L}_2(\Omega)} \, \mathrm{d}t \,,$$

the remaining terms are (we are using Fubini theorem)

$$\int_0^\tau \int_0^t \int_\Omega \mathbb{A} \nabla u \cdot \nabla u(t) \, \mathrm{d}s \, \mathrm{d}t = \int_\Omega \int_0^\tau \int_s^\tau \nabla u(t) \, \mathrm{d}t \, \mathbb{A}(s) \nabla u(s) \, \mathrm{d}s \,,$$

denote $\partial_s w(s) = -u(s)$, then

□

2 Sobolev spaces revisited

Let $\Omega \subset \mathbb{R}^d \quad open, p \in [1, +\infty], k \in N$. We define

$$\mathrm{W}^{\mathrm{k,p}}(\Omega) = \Big\{ f \in \mathrm{L_p}(\Omega) \,; D^\alpha f \in \mathrm{L_p}(\Omega) \,, \forall |\alpha| \le k \Big\},$$

with the norm

$$\| f \|^p_{\mathrm{W}^{\mathrm{k,p}}(\Omega)} = \| f \|^p_{\mathrm{L_p}(\Omega)} + \sum_{0 < |\alpha| \le k} \| D^\alpha f \|^p_{\mathrm{L_p}(\Omega)}.$$

Recall that:

- $\mathrm{W}^{\mathrm{k,p}}(\Omega)$ is Banach $\forall p$ and Hilbert for $p = 2$.
- $\mathrm{W}^{\mathrm{k,p}}(\Omega)$ is separable if $p < \infty$ and reflexive if $p > 1, p < \infty$.

Our goal will be to prove embedding and trace theorems. We will use the density of smooth functions.

2.1 Tools from functional analysis

Definition 1 (Regularization kernel)**.** The function η is called the regularization kernel supposed:

- $\eta \in \mathcal{D}(\mathbb{R}^d)$
- $\operatorname{supp} \eta \subset \mathrm{U}(0,1)$
- $\eta \geq 0$
- η is radially symmetric
- $\int_{\mathbb{R}^d} \eta(x)\,\mathrm{d}x = 1$

Definition 2 (Regularization of a function)**.** Let η be a regularization kernel. Set $\eta_\varepsilon(x) = \varepsilon^{-d}\eta(x/\varepsilon), \varepsilon > 0$. We define the smoothing of f by

$$f_\varepsilon(x) = (f \star \eta_\varepsilon)(x).$$

Remark (Propertios of regularization). The regularization has the following properties:

- $f \in \mathrm{L_p}(\Omega) \Rightarrow f_\varepsilon \to f \,\mathrm{in}\, \mathrm{L_p}(\Omega)$ and also a.e
- $f \in \mathrm{L}_\infty(\Omega) \Rightarrow f_\varepsilon \to f$ a.e and *-weak
- $f_\varepsilon(x) = \int_{\mathbb{R}^d} f(y)\eta_\varepsilon(x-y)\,\mathrm{d}y = \int_{\mathrm{U}(x,\varepsilon)} f_y \eta_\varepsilon(x-y)\,\mathrm{d}y$
- $\operatorname{supp} f_\varepsilon \subset \overline{U(\Omega,\varepsilon)}, f = 0 \,\mathrm{on}\, \mathrm{U}(x,\varepsilon) \Rightarrow f_\varepsilon(x) = 0$

Definition 3 ($\Omega' \subset\subset \Omega$)**.** $O \subset\subset \Omega$ means $\overline{O}$ is compact and $\overline{O} \subset \Omega$.

Lemma 1 (Approximation of Sobolev functions using regularization)**.** *Assume* $p \in [1,\infty), \Omega \subset \mathbb{R}^d$ *open*$, k \in \mathbb{N}, u \in W^{k,p}(\Omega), \Omega' \subset\subset \Omega$*. Then it holds*

1. $\operatorname{dist}(\overline{\Omega}', \partial\Omega) = D > 0$
2. $D^\alpha(f_\varepsilon) = (D^\alpha f)_\varepsilon$ *in* $\Omega', \forall \varepsilon \in (0,D), \forall |\alpha| \leq k$
3. $f_\varepsilon \to f$ *in* $W^{k,p}(\Omega), \varepsilon \to 0^+$

Proof.

1. disjoint compact and closed set
2. WLOG $\frac{\partial f_\varepsilon}{\partial x^k} = \frac{\partial \int_{\mathbb{R}^d} f_y \eta_\varepsilon(x-y)\mathrm{d}y}{\partial x^k} = \int_\Omega f_y \frac{\partial \eta_\varepsilon}{\partial x^k}\,\mathrm{d}y = -\int_\Omega f(y) \frac{\partial \eta_\varepsilon}{\partial y^k}\,\mathrm{d}y = -\int_\Omega \frac{\partial f}{\partial y^k} \eta_\varepsilon(x-y)\,\mathrm{d}y = (D^\alpha f)_\varepsilon(x)$.
3. follows from 2) and the remark above applied to $f, D^\alpha f, |\alpha| \leq k$.

$\square$

Lemma 2 (Partition of unity)**.** *Let* $E \subset \mathbb{R}^d, \mathcal{G}$ *opencovering. Then there exists a countable system* $\mathcal{F}$ *of nonnegative functions* $\varphi \in \mathcal{D}(\mathbb{R}^d)$ *such that* $0 \leq \varphi \leq 1$ *and*

1. $\mathcal{F}$ *is subordinate to* $\mathcal{G} : \forall \varphi \exists U \in \mathcal{Q} : \operatorname{supp} \varphi \subset U$
2. $\mathcal{F}$ *is locally finite:* $\forall K \subset E$ *compact*$, \operatorname{supp} \varphi \cap K \neq \emptyset$ *for at most finitely many* $\varphi \in \mathcal{F}$.

3. $\sum_{\varphi\in\mathcal{F}}\varphi(x) = 1, \forall x \in E.$

Proof. (Sketch) *Step 1 (E is compact)*:

E compact $\Rightarrow \exists N \in \mathbb{N} : U_j \in \mathcal{Q} \quad s.t. E \subset \bigcup_{j=1}^{m} U_j$. Moreover, $\exists K_j \subset U_j$ compact such that $E \subset \cup_{j=1}^{m} K_j$. That follows from the exhaustion argument: for $U \subset \mathbb{R}^d$ open, you can approximate it by a compact set: $K_m = \left\{x \in U, \operatorname{dist}(x, \partial\Omega) \geq \frac{1}{m}, \|x\| \leq m\right\}$. Then clearly $K_1 \subset K_2 \ldots$, and they "converge monotonously to U. Next, find $\phi_j \in C_c(U_j), \phi_j > 0 \,\text{on}\, K_j$, e.g. $\phi_j = \theta(\operatorname{dist}(x, \partial U_j))$. Then use convolution: $\psi_j = (\phi_j)_\varepsilon, \varepsilon > 0$ small and take finally $\varphi_j = \frac{\psi_j}{\sum_j \psi_j}$.

Step 2 (E is open):

Use exhaustion argument, then finite → countable. □

2.2 Density of smooth functions

Theorem 4 (Density of smooth functions I)**.** *Let* $\Omega \subset \mathbb{R}^d$ *be open,* $k \in \mathbb{N}, p \in [1, \infty)$. *Then* $\left\{f \in C^\infty(\Omega), \operatorname{supp} f \quad bounded\right\} \cap W^{k,p}(\Omega)$ *is dense in* $W^{k,p}(\Omega)$.

Proof. Let $u \in \mathrm{W}^{\mathrm{k,p}}(\Omega), \varepsilon > 0$. I want to show $\exists v \in C^\infty(\Omega) \cap \mathrm{W}^{\mathrm{k,p}}(\Omega) \quad s.t \|u - v\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega)} < \varepsilon$. Using the exhaustion argument, define

$$\Omega_j = \left\{x \in \Omega, \operatorname{dist}(x, \partial\Omega) > \frac{1}{j}\right\}.$$

Clearly, $\Omega_j \subset \Omega_{j+1}, \cup_{j=1}^{\infty}\Omega_j = \Omega$. Next, set $U_j = \Omega_{j+1} \; \overline{\Omega_{j-1}}, j = 1, 2, \ldots,$ where $\Omega_0 = \Omega_{-1} = \varnothing$. Using the partition of unity lemma, $\exists\{\varphi_j\}$ partition of unity subordinate to $\{U_j\}$. We can write $u = \sum_j u\varphi_j$, where $u\varphi_j \in \mathrm{W}^{\mathrm{k,p}}(\Omega), \operatorname{supp} u\varphi_j \subset U_j \subset \Omega_{j+1} \subset\subset \Omega$. This is ready for convolution with $\varepsilon_j > 0$ sufficiently small: set $v_j = (u\varphi_j)_{\varepsilon_j}$. By the properties of regularization, we now

$$\|u - u\varphi_j\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega)} < \frac{\varepsilon}{2^j},$$

by taking ε_j small enough. Set $v = \sum_j v_j$ and use the following trick:

Fix $N \in \mathbb{N}$ and estimate $\|v - u\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega)}$. Observe $u - v = \sum_{j=1}^{\infty}(u\varphi_j - v_j)$, so taking $x \in \Omega_N$ i have $(u - v)(x) = \sum_{j=1}^{N+1}(u\varphi_j - v_j)$. The norm of this is

$$\|u - v\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega_N)} \leq \sum_{j=1}^{N+1} \|u\varphi_j - v_j\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega)} < \varepsilon.$$

It only remains to let $N \to \infty$ and realize $\|u - v\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega_N)} \to \|u - v\|_{\mathrm{W}^{\mathrm{k,p}}(\Omega)}$ by Lévi's theorem: $\int_{\Omega_N} |D^\alpha f| \,\mathrm{d}x \to \int_\Omega |D^\alpha| \,\mathrm{d}x$. □

Remark. It is nice that we only require Ω to be open (no boundary regularity required), but on the other hand, we don't have any information about the function's behaviour near it.

Recall $\Omega \in C^0$ means $\exists U_j, j = 1, \ldots, m \quad open, \exists \alpha, \beta > 0, a_j : \overline{U(0, \alpha)} \to \mathbb{R}, \mathbb{A}_j : \mathbb{R}^d \to \mathbb{R}^d \quad aff.orthogonal, \quad such that \partial\Omega$ $\cup_{j=1}^{m} U_j, \partial\Omega \cap U_j = \left\{(x', a(x'), x' \in U(0, \alpha)\right\}$. Setting $G_j(x', b) = \mathbb{A}_j(x', a(x') + b)$ we moreover require $G_j(U(0, \alpha) \times (0, \beta)) \subset \Omega, G_j(U(0, \alpha) \times (-\beta, 0)) \subset \overline{\mathbb{R}^d/\Omega}$.

Definition 4 (Shift operator)**.** For $u \in \mathrm{L_p}(\Omega), k \in \{1,\ldots,d\}, h > 0$, we introduce the shift operator

$$\tau_h u(x) = u(x + h\mathbf{e}_k)$$

Lemma 3 (Approximation property of the shift operator)**.** *For $u \in L_p(\Omega)$, it holds $\tau_h u \to u$ in $L_p(\Omega), h \to 0^+$.*

Theorem 5 (Density of smooth functions II)**.** *Let $\Omega \in C^0$ bounded, $k \in \mathbb{N}, p \in [1,\infty)$. Then $C^\infty_{\overline{\Omega}}(\mathbb{R}^d)$ is dense in $W^{k,p}(\Omega)$.*

Proof. Let $u \in \mathrm{W^{k,p}}(\Omega), \varepsilon > 0 \quad given$, i am looking for $v \in C_c^\infty(\mathbb{R}^d) \quad such that \|u - v\|_{\mathrm{W^{k,p}}(\Omega)} < \varepsilon$.

The sketch is simple: covering of $\overline{\Omega}$, partition of unity. Clearly, $\Omega \subset \cup_{j=0}^m U_j$, where $U_0 = \Omega, U_j$ are from the definition of C^0 boundary. Take $\{\varphi_j\}$ to be the partition of unity on $\overline{\Omega}$, subordinate to this cover. Observe that $u\varphi_j \in \mathrm{W^{k,p}}(\Omega), \operatorname{supp} u\varphi_j \subset U_j$. Find

$$v_j \in \mathcal{D}(\mathbb{R}^d) \quad s.t. \|v_j - u\varphi_j\|_{\mathrm{W^{k,p}}(\Omega)} < \frac{\varepsilon}{m+1}.$$

If i am able to do this, i am finished: just take

$$v = \sum_{j=0}^m v_j$$

.

Case $j = 0$. We have $\operatorname{supp} u\varphi_0 \subset\subset \Omega$, take $v_0 = (u\varphi_0)_\varepsilon$, so if we take $\varepsilon > 0$ small enough, i can use the previous lemma.

Case $j \in \{1,\ldots,m\}$. Set $w_j = u\varphi_j, \tau_\delta w_j(x', x_d) = w(x', x_d + \delta)$ (ignore $\mathbb{A}_{\mathbb{j}}$), observe $t_\delta u_j \in \mathrm{W^{k,p}}(U_j^\delta), U_j \subset\subset U_j^\delta$. Finally, set $v_j = (t_\delta w_j)_{\varepsilon_j}, \varepsilon_j > 0$ small enough. From the properties of the shift $\tau_\delta w_j$ is close to w_j in $\mathrm{L_p}(U_j \cap \Omega)$ and $D^\alpha \tau_\delta w_j = \tau_\delta(D^\alpha w_j)$ close to $D^\alpha w_j$ in $\mathrm{L_p}(U_j \cap \Omega)$. Finally, set $v_j = (t_\delta w_j)_{\varepsilon_j}, \varepsilon_j > 0$ small enough $\Rightarrow v_j \in \mathcal{D}(\mathbb{R}^d), \operatorname{supp} v_j \subset U_j$ by the previous lemma $\|v_j - \tau_\delta w_j\|_{\mathrm{W^{k,p}}(\Omega)}$ small.

□

Remark. Recall $C^\infty_{\overline{\Omega}}(\mathbb{R}^d) = \left\{u|_{\overline{\Omega}}, u \in C^\infty(\mathbb{R}^d)\right\}$.

2.3 Extension of Sobolev functions

Problem of extension: For $u \in \mathrm{W^{k,p}}(\Omega)$, does there exist $\overline{u} \in \mathrm{W^{k,p}}(\mathbb{R}^d), \quad s.t. \overline{u}|_\Omega = u, \|\overline{u}\|_{\mathrm{W^{k,p}}(\mathbb{R}^d)} \le C(\Omega)\|u\|_{\mathrm{W^{k,p}}(\Omega)}$?

The answer is **yes**, if Ω is nice enough.

Lemma 4. *Let $\alpha, \beta > 0, K \subset U(0,\alpha) \times [\alpha, \beta]$ be compact. Then*

$$\exists C > 0, \exists E : C^1(\overline{U(0,\alpha)} \times [0,\beta]) \to C^1(\overline{U(0,\alpha)} \times [-\beta,\beta]), \exists \tilde{K} \subset U(0,\alpha) \times [-\beta, b) \; compact$$

such that:

1. $\|Eu\|_{W^{1,p}(U(0,\alpha)\times(-\beta,\beta))} \le \|u\|_{W^{1,p}(U(0,\alpha)\times(-\beta,\beta))}$
2. *if* $\operatorname{supp} u \subset K \Rightarrow \operatorname{supp} Eu \subset \tilde{K}$

Proof. Use the following trick:

$$\overline{u}(x) = \begin{cases} u(x), & x_d > 0 \\ -3u(x_1, \dots, x_{d-1}, -x_d) + 4u(x_1, \dots, x_{d-1}, -\frac{x_d}{2}), & x_d < 0. \end{cases}$$

Is this extension C^1? Take some $a = (x_1, \dots, x_{d-1}, 0)$. Then

$$u(x \to a) = \begin{cases} u(a), & x_d > 0 \\ -3u(a) + 4u(a) = u(a), & x_d < 0, \end{cases}$$

so $\overline{u}$ is continuous. Its derivative

$\partial_k \overline{u}, k = 1, \dots, d-1$ is the same as for u, where as

$$\partial_d \overline{u} = \begin{cases} \partial_d u, & x_d > 0 \\ -3\partial_d u(x_1, \dots, x_{d-1}, -x_d)(-1) + 4\partial_d u(x_1, \dots, x_{d-1}, -\frac{x_d}{2})(\frac{-1}{2}) = 3\partial_d u - 2\partial_d u, & x_d < 0, \end{cases}$$

so the the derivative is also continuous. Thus, we have $Eu = \overline{u} \in C^1 \subset \mathrm{W}^{1,p}(U(0,\alpha) \times (-\beta, \beta))$ and estimate of the norm $\|Eu\|_{\mathrm{W}^{1,p}(U(0,\alpha)\times(-\beta,\beta))}$ is clear, as the wanted term is just some linear combination.

Mr. Prazak is not sure how this should be correctly finished and i am not also. □

Lemma 5 (Change of variables under C^1 diffeomorphisms)**.** *Let $U, V \subset \mathbb{R}^d$ be open, $\phi : U \to V$ be C^1 diffeomorphism. Let $\tilde{U} \subset\subset U$. Then*

$$\phi(\tilde{U}) \subset\subset V, \textit{ and } \exists C > 0 : \forall u \in C^1(V) : \|u \circ \phi\|_{W^{1,p}(\tilde{U})} \le C\|u\|_{W^{1,p}(\phi(\tilde{U}))}$$

Proof. $\|u \circ \phi\|^p_{\mathrm{L_p}(\tilde{U})} = \int_{\tilde{U}} (u\circ\phi)^p |\det \nabla\phi| \,\mathrm{d}x \le C_0^{-1} \int_{\tilde{U}} |u\circ\phi|^p |\det \nabla\phi| \,\mathrm{d}x$, where $\det \nabla\phi > 0$ in U, so $\det \nabla\phi \ge C_0 > 0$ in $\tilde{U}$. Together $\|u \circ \phi\|^p_{\mathrm{L_p}(\tilde{U})} = C_0^{-1} \int_{\phi(\tilde{U})} |u|^p \,\mathrm{d}x = C_0^{-1} \|u\|_{\mathrm{L_p}(\phi(\tilde{U}))}$ □

Lemma 6. *Let $\alpha, \beta > 0, K \subset U(0,\alpha)\times[0,\beta), K$ compact. Then there is $C > 0, E : C^1\Big(\overline{U(0,\alpha) \times [0,\beta)}\Big) \to C^1\Big(\overline{U(0,\alpha)} \times [-\beta,\beta]\Big), \tilde{K} \subset U(0,\alpha) \times [-\beta,\beta)$ compact such that*

- $\|E\|_{\mathcal{L}(W^{1,p}(U(0,\alpha)\times(0,\beta)), W^{1,p}(U(0,\alpha)\times(-\beta,\beta))} \le C$
- $u \in C^1\Big(\overline{U(0,\alpha)} \times [0,\beta]\Big), \operatorname{supp} u \subset K \Rightarrow \operatorname{supp} Eu \subset \tilde{K}$

Proof. No proof. □

Lemma 7. *Let $U, V \subset \mathbb{R}^d$ open, $\Phi : U \to V, C^1$ diffeomoprhism, $\tilde{U} \subset\subset U$ compact. Then $\Phi(\tilde{U}) \subset\subset V$ and*

$$\exists C > 0 : \forall u \in C^1(V) : \|u \circ \Phi\|_{W^{1,p}(\tilde{U})} \le C\|u\|_{W^{1,p}(\Phi(\tilde{U}))}.$$

Proof. No proof. □

Theorem 6 (Extension of Sobolev functions)**.** *Let $\Omega \in C^{k-1,1}, k \in \mathbb{N}, p \in [1,\infty], V \subset \mathbb{R}^d$ open such that $\Omega \subset\subset V$. Then there is $E : W^{k,p}(\Omega) \to W^{k,p}\big(\mathbb{R}^d\big)$ bounded linear operator such that*

1. $\forall u \in W^{k,p}(\Omega) : Eu = u$ *a.e. in* Ω,

2. $\forall u \in W^{k,p}(\Omega) : \operatorname{supp} Eu \subset V$,

3. $\|E\| \leq C, C = C(p, \Omega, V)$.

Proof. Only for $k = 1, \Omega \in C^1, p < \infty$. We know $C^\infty_{\overline{\Omega}}(\mathbb{R}^d)$ is dense in $\mathrm{W}^{1,p}(\Omega)$, we show existence of E for $u \in C^\infty_{\overline{\Omega}}(\mathbb{R}^d)$ with properties 1),2),3) and then extend E to $\mathrm{W}^{1,p}(\Omega)$ by density.
Covering of Ω*:*

$$\overline{\Omega} \subset \Omega \cup \bigcup_{j=1}^{m} U_j$$

with $U_j, a_j, \mathbb{A}_j, \alpha, \beta$ as in the definition of a C^1 domain. In particular, $a_j \in C^1(\mathrm{U}(0, \alpha))$.
Construction of E*:* We denote $\{\varphi_j\}_{j=0}^m$ partition of unity subordinate to $\{U_j\}_{j=1}^m$. For $j \in \{1, \ldots, n\}$ we define $\phi_j : \mathrm{U}(0, \alpha) \times (-\beta, \beta) \to U_j$ by

$$\phi_j(y', y_d) = \mathbb{A}_j(y', a_j(y') + y_d), y' \in \mathbb{R}^{d-1}, y_d \in \mathbb{R}.$$

Trivially ϕ_j is C^1 diffemorphism. Let us denote by $\tilde{E}$ the extension operator from the previous lemma. Then we have for $u \in C^\infty_{\overline{\Omega}}(\mathbb{R}^d) : u = \sum_{j=1}^m \varphi_j u$. We define

$$Eu = \varphi_0 u + \sum_{j=1}^{m} \left(\eta \tilde{E}((\varphi_j u) \circ \phi_j)\right) \circ \phi_j^{-1},$$

where η is a cut-off function $\eta = 1 \,\mathrm{on}\, y_d \geq 0, \in (0,1) \,\mathrm{else}\,, = 0 \,\mathrm{on}\, y_d \leq -h$, for some parameter $h > 0$ which will be defined later. We also take $\eta \in C^\infty$. Due to our construction,

$$\phi_j^{-1}(\mathrm{U}(0, \alpha) \times [-2h, \beta)) \subset \mathrm{U}(\Omega, \varepsilon) \subset \mathrm{U}(\Omega, 2\varepsilon) \subset V,$$

for some $\varepsilon > 0$.
Properties of E*:* It is clear that

- E is linear from its definition
- 1) holds, as ϕ_j and ϕ_j^{-1} cancel *somewhere*
- 2) holds for $h < \frac{\beta}{2}$
- 3) we use the previous lemma:

$$\begin{aligned}
\left\| \underbrace{\left(\eta \tilde{E}(\varphi_j u \circ \phi_j)\right)}_{\operatorname{supp}() \subset \mathrm{U}(0,\alpha) \times (-\beta,\beta)} \circ \phi_j^{-1} \right\|_{\mathrm{W}^{1,p}(\mathbb{R}^d)} &\leq C \left\| \eta \tilde{E}(\varphi_j u \circ \phi_j) \right\|_{\mathrm{W}^{1,p}(\mathrm{U}(0,\alpha) \times (-\beta,\beta))} \\
&\underbrace{\leq}_{\text{previous lemma}} C \|\varphi_j u \circ \phi_j\|_{\mathrm{W}^{1,p}(\mathrm{U}(0,\alpha) \times (0,\beta))} \\
&\underbrace{\leq}_{\text{previous lemma}} C \|\varphi_j u\|_{\mathrm{W}^{1,p}(U_j \cap \Omega)} \leq \|u\|_{\mathrm{W}^{1,p}(\Omega)} \Rightarrow \|E\| \leq C.
\end{aligned}$$

So all the properties hold for $u \in C^\infty_{\overline{\Omega}}(\mathbb{R}^d)$. We need to show them also for $u \in \mathrm{W}^{1,p}(\Omega)$. Pick an arbitrary $u \in \mathrm{W}^{1,p}(\Omega)$, find $\{u_k\} \subset C^\infty_{\overline{\Omega}}(\mathbb{R}^d) : u_k \to u \,\text{in}\, \mathrm{W}^{1,p}(\Omega)$.
Ad 1): Since E is continuous, then $Eu_k \to Eu \,\text{in}\, \mathrm{W}^{1,p}(\mathbb{R}^d)$. Since $\Omega \subset \mathbb{R}^d \Rightarrow Eu = u \,\text{in}\, \mathrm{W}^{1,p}(\Omega)$.
Ad 2): $\operatorname{supp} Eu_k \subset \mathrm{U}(\Omega, \varepsilon) \Rightarrow \operatorname{supp} Eu \subset \overline{\mathrm{U}(\Omega,\varepsilon)} \subset V$.

□

Remark ($\Omega \in C^{0,1}$ suffices). The theorem is still valid if we assume only $C^{0,1}$ and $p \in (1,\infty), k > 1$.

2.4 Embedding theorems

Example. Let $u \in \mathcal{D}(\mathbb{R}^2)$. Then

$$u(x_1,x_2) = \int_{-\infty}^{x_1} \partial_1 u(s,x_2)\,\mathrm{d}s = \int_{-\infty}^{x_2} \partial_2 u(x_1,s)\,\mathrm{d}s\,,$$

so

$$\int_{\mathbb{R}^2}\int_{\mathbb{R}^2} |u(x_1,x_2)|^2 \,\mathrm{d}x_1\,\mathrm{d}x_2 \le \int_{\mathbb{R}} |\partial_1 u(s,x_2)|\,\mathrm{d}s \int_{\mathbb{R}} |\partial_2 u(x_1,s)\,|\,\mathrm{d}s\,\mathrm{d}x_1\,\mathrm{d}x_2 \le \Big(\int_{\mathbb{R}^2} |\nabla u|^2 \,\mathrm{d}\lambda^2\Big)^2,$$

so

$$\|u\|_{\mathrm{L}_2(\mathbb{R}^2)} \le \|\nabla u\|_{\mathrm{L}_1(\mathbb{R}^2)}.$$

Lemma 8. *Let $d \ge 2$. Let $\hat{u}_i : \mathbb{R}^{d-1} \to \mathbb{R}$ be nonnegative and measurable for $j \in \{1,\dots,d\}$. We define*

$$\hat{x_j} = (x_1,\dots,x_{j-1},x_{j+1},\dots,x_d), \mathrm{d}\hat{\mathrm{x}}_\mathrm{j} = \mathrm{d}x_1 \dots \mathrm{d}x_{j-1}\,\mathrm{d}x_{j+1}\dots\mathrm{d}x_d\,.$$

Consider the functions $u_j : \mathbb{R}^d \to \mathbb{R}, u_j(x) = \hat{u_j}(\hat{x_j})$. Then

$$\int_{\mathbb{R}^d} \prod_{j=1}^d u_j(x)\,\mathrm{d}x \le \prod_{j=1}^d \Big(\int_{\mathbb{R}^{d-1}} (\hat{u_j}(\hat{x_j}))^{d-1} \mathrm{d}\hat{\mathrm{x}}_\mathrm{j}\Big)^{\frac{1}{d-1}}. \tag{1}$$

Proof. Induction by d.

1. $d = 2 : \int_{\mathbb{R}^d} u_1(x_1,x_2)u_2(x_1,x_2)\,\mathrm{d}x_1\,\mathrm{d}x_2 = \int_{\mathbb{R}^2} \hat{u}_1(x_2)\hat{u}_2(x_1)\,\mathrm{d}x_1\,\mathrm{d}x_2 \underbrace{=}_{\text{Fubini}} \int_{\mathbb{R}} \hat{u}_1(x_2)\,\mathrm{d}x_2 \int_{\mathbb{R}} \hat{u}_2\,\mathrm{d}x_1\,.$

2.

$$\begin{aligned}
d \to d+1 : \int_{\mathbb{R}^{d+1}} \prod_{j=1}^{d+1} u_j(x)\,\mathrm{d}x &= \int_{\mathbb{R}^d}\int_{\mathbb{R}} \prod_{j=1}^{d} u_j(x)\,\mathrm{d}x_{d+1}\, u_{d+1}\,\mathrm{d}x\,\mathrm{d}\hat{\mathrm{x}}_{\mathrm{d+1}} \\
&\underbrace{\le}_{\text{Holder}} \int_{\mathbb{R}^d} \Bigg(\prod_{j=1}^d \int_{\mathbb{R}} (u_j(x))^d\,\mathrm{d}x_{d+1}\Bigg)^{\frac{1}{d}} u_{d+1}(x)\mathrm{d}\hat{\mathrm{x}}_{\mathrm{d+1}} \\
&\underbrace{\le}_{\text{Holder}} \Bigg(\int_{\mathbb{R}^d}\Bigg(\prod_{j=1}^d \int_{\mathbb{R}} u_j^d(x)\,\mathrm{d}x_{d-1}\Bigg)^{\frac{1}{d-1}} \mathrm{d}x_{\hat{d+1}}\Bigg)^{\frac{d-1}{d}} \Big(\int_{\mathbb{R}^d} u_{d+1}^d\,\mathrm{d}x_{\hat{d+1}}\Big)^{\frac{1}{d}} \\
&\underbrace{\le}_{\text{induction step}^1} \Big(\int_{\mathbb{R}^d} u_{d+1}^d\,\mathrm{d}\hat{x}_{d+1}\Big)^{\frac{1}{d}} \Bigg(\prod_{j=1}^d \int_{\mathbb{R}^{d-1}}\int_{\mathbb{R}} u_j^d(x)\,\mathrm{d}x_{d+1}\,\mathrm{d}\hat{x}_j\,\mathrm{d}\hat{x}_{d+1}\Bigg)^{\frac{d-1}{d}\frac{1}{d-1}}.
\end{aligned}$$

$\square$

Theorem 7 (Gagliardo-Nirenberg)**.** *Let* $p \in [1,d)$*. Then* $\forall u \in W^{1,p}(\mathbb{R}^d)$*:*

$$\|u\|_{L_{p^*}(\mathbb{R}^d)} \leq \frac{p(d-1)}{d-p} \|\nabla u\|_{L_p(\mathbb{R}^d)},$$

where $p^* = \frac{dp}{d-p}$.

Proof. Estimate for $u \in \mathcal{D}(\mathbb{R}^d)$:

$$\forall j \in \{1,\dots,d\}, x \in \mathbb{R}^d : u(x) = \int_{-\infty}^{x_j} \partial_j u(x_1,\dots,x_{j-1},s,x_{j+1},\dots,x_d)\,\mathrm{d}s$$

independet of x_j, so

$$|u(x)| \leq \int_{\mathbb{R}} |\nabla u|(\dots,s,\dots)\,\mathrm{d}s\,.$$

Next, consider $p=1, p^* = \frac{d}{d-1}$ and estimate:

$$|u|^{\frac{d}{d-1}} \leq \prod_{j=1}^{d} \underbrace{\left(\int_{\mathbb{R}} |\nabla u|(\dots,s,\dots)\,\mathrm{d}s\right)^{\frac{1}{d-1}}}_{u_j \text{ independent of } x_j},$$

so the integral

$$\int_{\mathbb{R}^d} |u|^{\frac{d}{d-1}}\,\mathrm{d}x \leq \int_{\mathbb{R}^d} \prod_{j=1}^{d} u)j\,\mathrm{d}x \underbrace{\leq}_{\text{previous lemma}} \left(\prod_{j=1}^{d} \int_{\mathbb{R}^{d-1}} \int_{\mathbb{R}} |\nabla u|(x)\,\mathrm{d}x_j\,\mathrm{d}\hat{x}_j\right)^{\frac{1}{d-1}} = \left(\int_{\mathbb{R}^d} |\nabla u|\,\mathrm{d}x\right)^{\frac{d}{d-1}}.$$

If $p \in (1,d)$, compute

$$\|u\|^q_{\mathrm{L}_{\frac{qd}{d-1}}(\mathbb{R}^d)} = \||u|^q\|_{\mathrm{L}_{\frac{d}{d-1}}(\mathbb{R}^d)} \leq \|\nabla(|u|^q)\|_{\mathrm{L}_1(\mathbb{R}^d)} = \int_{\mathbb{R}^d} q|u|^{q-1}|\nabla u|\,\mathrm{d}x \underbrace{\leq}_{\text{Holder}} \|\nabla u\|_{\mathrm{L}_p(\mathbb{R}^d)} \|u\|^{q-1}_{\mathrm{L}_{(q-1)p'}(\mathbb{R}^d)}.$$

We want $\frac{(q-1)p'}{p-1} = \frac{qd}{d-1}$, so

$$q\left(\frac{p}{p-1} - \frac{d}{d-1}\right) = \frac{p}{p-1}, \Leftrightarrow q\frac{pd-p-pd+d}{(p-1)(d-1)} = \frac{d-p}{(p-1)(d-1)} = \frac{p}{p-1} \Leftrightarrow q = \frac{d-1}{d-p}p.$$

Also

$$q\frac{d}{d-1} = p^*.$$

$\Rightarrow$ statement holds for $u \in \mathcal{D}(\mathbb{R}^d)$. To finish, use density of $\mathcal{D}(\mathbb{R}^d)$ in $\mathrm{W}^{1,p}(\mathbb{R}^d)$. $\square$

Remark.
- It is evident that nonzero constants are not in $\mathrm{W}^{1,p}(\mathbb{R}^d)$ and that also the inequality does not hold for them.
- the set $\mathbb{R}^d$ is of course unbounded, so we have no ordering of $\mathrm{L_p}(\Omega)$ spaces.

- of course, we require no smoothness of the domain

Theorem 8. *Let $\Omega \subset \mathbb{R}^d$ be open. Then $\forall u \in W_0^{1,p}(\Omega), \forall p \in [1,d)$ the statement of the previous theorem holds.*

Proof. An immediate corollary of the previous theorem. □

Remark. In the proof of theorem we showed that $\forall u \in \mathrm{W}^{1,p}(\mathbb{R}^d)$ it holds

$$\|u\|^q_{\mathrm{L}_{\frac{qd}{d-1}}(\Omega)} \leq q\|\nabla u\|_{\mathrm{L_p}(\Omega)}\|u\|^{q-1}_{\mathrm{L}_{\frac{p(q-1)}{p-1}}(\Omega)},$$

for q such that $\frac{qd}{d-1} \leq p^*$.

Theorem 9 (Embedding theorem)**.** *Let $\Omega \subset C^{0,1}, p^* = \frac{dp}{1-p}$ If $p \in [1,d)$ then*

$$W^{1,p}(\Omega) \subset L_q(\Omega)\,\forall q \in [1,p^*].$$

Moreover, if $q < p^*$, then

$$W^{1,p}(\Omega) \subset\subset L_q(\Omega)\,.$$

If $p = d$, then

$$W^{1,p}(\Omega) \subset L_q(\Omega)\,\forall q < \infty,\, W^{1,p}(\Omega) \subset\subset L_q(\Omega)\,\forall 1 \leq q < \infty.$$

Proof. We would like to use the previous theorem + extension.

Ad continuity for $p < d : E : \mathrm{W}^{1,p}(\Omega) \to \mathrm{W}^{1,p}(\mathbb{R}^d)$ the extension is continuous. We also know

- identity $I_1 : \mathrm{W}^{1,p}(\mathbb{R}^d) \to \mathrm{L}_{p^*}(\mathbb{R}^d)$ is continous,
- restriction $I_2 : \mathrm{L}_{p^*}(\mathbb{R}^d) \to \mathrm{L}_{p^*}(\Omega)$ is continuous,
- identity $I_3 : \mathrm{L}_{p^*}(\Omega) \to \mathrm{L}_q(\Omega)$ is continous.

Together, the mapping $id : \mathrm{W}^{1,p}(\Omega) : \mathrm{L}_q(\Omega), id = I_3 \circ I_2 \circ I_1 \circ E$ identity is continuous. If p=d, then $\mathrm{W}^{1,d}(\Omega) \subset \mathrm{W}^{1,r}(\Omega)\,\forall r \in [1,d)$, and $r^* \to \infty$ as $r \to d-$. For $q \in [1,\infty)$ find $r \in [1,d)$ s.t. $r^* > q$. Then

$$\mathrm{W}^{1,d}(\Omega) \subset \mathrm{W}^{1,r}(\Omega) \subset \mathrm{L}_{r^*}(\Omega) \subset \mathrm{L}_q(\Omega)\,,$$

using the previous results.

Ad compactness: We show $\mathrm{W}^{1,p}(\Omega) \subset\subset \mathrm{L}_q(\Omega)$ using Arzela-Ascoli and then it will get technical: show compactness in smooth functions, then show compactness in $\mathrm{L}_1(\Omega)$, then approximate the norm of $\mathrm{L}_q(\Omega)$ using the obtained quantities.

Consider $B = \mathrm{U}_{\mathrm{W}^{1,p}(\Omega)}(0,1)$ and extend it to EB. Fix $\delta > 0$ and let η be a regularization kernel. Then $\exists R > 0 : \operatorname{supp}(EB)_\delta \subset \overline{\mathrm{U}(0,R)} \subset \mathbb{R}^d$ (i.e. all the functions from EB have the support contained in the ball). Moreover, $(EB)_\delta \subset C^1\left(\overline{\mathrm{U}(0,R)}\right)$. Actually, it is bounded in $C^1\left(\overline{\mathrm{U}(0,R)}\right)$. $\underbrace{\subset\subset}_{\text{Arzela-Ascoli}}$ $C\left(\overline{\mathrm{U}(0,R)}\right)$ (uniform equicontinuity comes from uniform boundedness of the gradients, $\nabla(u * \eta_\delta) = u * \nabla\eta_\delta$.) Altogether $(EB)_\delta$ is relatively compact in

$$C\left(\overline{\mathrm{U}(0,R)}\right) \underbrace{\Rightarrow}_{\text{the space } C\left(\overline{\mathrm{U}(0,R)}\right) \text{ is complete}} \text{bounded in } C\left(\overline{\mathrm{U}(0,R)}\right) \underbrace{\Rightarrow}_{\text{bounded domain}} \text{bounded in } \mathrm{L}_1(\mathrm{U}(0,R))\,.$$

Next, take

$$u \in B : \|u - (Eu)_\delta\|_{\mathrm{L}_q(\Omega)} \le \|Eu - (Eu)_\delta\|_{\mathrm{L}_q(\mathrm{U}(0,R))} = \int_{\mathrm{U}(0,R)} |v - v_\delta| \,\mathrm{d}x = \int_{\mathbb{R}^d} \Big| \int_{\mathbb{R}^d} v(x+y) - v(x) \eta_\delta(y) \,\mathrm{d}y \Big| \,\mathrm{d}x \le$$

$$\le \int_{\mathbb{R}^d} \Big| \int_{\mathbb{R}^d} \frac{|v(x+y) - v(x)|}{|y|} |\eta_\delta(y)| |y| \,\mathrm{d}y \,\mathrm{d}x \underbrace{\le}_{\text{Fubini}} \int_{\mathbb{R}^d} \int_{\mathbb{R}^d} \frac{|v(x+y) - v(x)|}{|y|} \,\mathrm{d}x \, |y| \eta_\delta(y) \,\mathrm{d}y \,.$$

Estimate the inner integral: assume v is smooth and write

$$\int_{\mathbb{R}^d} \frac{1}{|y|} \Big| \int_0^1 \underbrace{\frac{\mathrm{d}}{\mathrm{d}s}(v(x+sy))}_{\nabla v(x+sy) \cdot y} \,\mathrm{d}s \Big| \,\mathrm{d}x \underbrace{\le}_{\text{Cauchy Schwartz}} \int_{\mathbb{R}^d} \int_0^1 |\nabla v|(x+sy) \,\mathrm{d}s \,\mathrm{d}x \underbrace{\le}_{\text{Holder}} C(R) \Big(\int_{\mathbb{R}^d} |\nabla v|^p \,\mathrm{d}x \Big)^{\frac{1}{p}} .$$

Now, take $v \in \mathrm{W}_0^{1,p}(\mathrm{U}(0,R))$, then $\exists \{v_k\} \subset \mathcal{D}(\mathrm{U}(0,R)) : v_k \to v \,\text{in}\, \mathrm{W}^{1,p}(\mathrm{U}(0,R))$. So

$$\forall y \in \mathbb{R}^d : \int_{\mathbb{R}^d} \frac{|v_k(x+y) - v_k(x)|}{|y|} \,\mathrm{d}x \le C(R) \Big(\int_{\mathbb{R}^d} |\nabla v_k|^p \,\mathrm{d}x \Big)^{\frac{1}{p}} \to C(R) \Big(\int_{\mathbb{R}^d} |\nabla v|^p \,\mathrm{d}x \Big)^{\frac{1}{p}} .$$

So finally

$$\|u - (Eu)_\delta\|_{\mathrm{L}_q(\Omega)} \le \int_{\mathbb{R}^d} \int_{\mathbb{R}^d} \frac{|v(x+y) - v(x)|}{|y|} \,\mathrm{d}x \, |y| \eta_\delta(y) \,\mathrm{d}y \underbrace{\le}_{|y| \le \delta} C(R) \delta \int_{\mathbb{R}^d} \Big(\int_{\mathbb{R}^d} |\nabla u|^p \,\mathrm{d}x \Big)^{\frac{1}{p}} \,\mathrm{d}x \le C_1 \delta.$$

Fix $\varepsilon > 0$, find finite $\frac{\varepsilon}{2}$-net in $(EB)_\delta$ in $\mathrm{L}_1(\mathrm{U}(0,R))$ (that is possible since we have total boundedness in $\mathrm{L}_1(\mathrm{U}(0,R))$.) Set $\delta > 0 \,\text{s.t.}\, C_1 \delta \frac{\varepsilon}{4}$. [2]. Denote the $\frac{\varepsilon}{2}$-net as $\{Eu_k\}_{k=1}^m, m \in \mathbb{N}$. We show $\{u_k\}_{k=1}^m$ is a ε-net in B. Fix $u \in B$, find $j \in \{1, \dots, m\} : \|(Eu)_\delta - (Eu_j)_\delta\|_{\mathrm{L}_1(\mathrm{U}(0,R))}$. Compute

$$\|u - u_j\|_{\mathrm{L}_1(\Omega)} \le \|u - (Eu)_\delta\|_{\mathrm{L}_1(\Omega)} + \left\|(Eu)_\delta - (Eu_j)_\delta\right\|_{\mathrm{L}_1(\Omega)} + \left\|(Eu_j)_\delta - u_j\right\|_{\mathrm{L}_1(\Omega)} \le 2C_1\delta + \frac{\varepsilon}{2} \le \varepsilon.$$

Thus, we have shown

$$\mathrm{W}^{1,p}(\Omega) \subset\subset \mathrm{L}_1(\Omega) .$$

It remains to show the validity for a general q. Let $q \in [1, p^*) : \|v\|_{\mathrm{L}_q(\Omega)} \le \|v\|_{\mathrm{L}_1(\Omega)}^\alpha \|v\|_{\mathrm{L}_{p^*}(\Omega)}^{1-\alpha}$, for $\frac{1}{q} = \alpha + \frac{1-\alpha}{p^*}, \alpha \in (0,1]$. Is B totally bounded in $\mathrm{L}_q(\Omega)$? Let us compute

$$\|u - u_j\|_{\mathrm{L}_q(\Omega)} \le \|u - u_j\|_{\mathrm{L}_1(\Omega)}^\alpha \underbrace{\|u - u_j\|_{\mathrm{L}_{p^*}(\Omega)}^{1-\alpha}}_{\le C, \mathrm{W}^{1,p}(\Omega) \subset \mathrm{L}_{p^*}(\Omega)} \le C\varepsilon^\alpha .$$

□

3 Nonlinear elliptic equations as compact perturbations

Theorem 10 (Nemytskii)**.** *Let $f : \Omega \times \mathbb{R}^N \to \mathbb{R}, N \in N, \Omega \subset \mathbb{R}^d$ measurable, f Caratheodory. Then*

1. *if $u : \Omega \to \mathbb{R}^N$ is measurable then $f(\cdot, u)$ is also measurable*
2. *If there is $p_i \in [1, +\infty), i \in \{1, \ldots, N\}, q \in [1, \infty), g \in L_q(\Omega), C > 0$ such that for almost all*

$$x \in \Omega, \forall y \in \mathbb{R}^N : |f(x,y)| \le g(x) + c \sum_{i=1}^{N} |y_i|^{p_i/q}$$

   , then $u \mapsto f(\cdot, u)$ is continuous from $L_{p_i}(\Omega) \times \cdots \times L_{p_N}(\Omega)$ to $L_q(\Omega)$. Moreover, it maps bounded sets to bounded sets.

Proof. No proof □

Definition 5 (Compact operator — Drábek, Milota: Methods of Nonlinear Analysis, Def 5.2.2)**.** Let X, Y be normed linear spaces, $M \subset X$. The mapping $F : M \to Y$ is called a compact operator on M into Y if F is continuous and $F(M \cap K)$ is relatively compact in Y for any bounded $K \subset X$.

Remark. We have no linearity of F! So continuity cannot follow from compactness (we have compactness $\Rightarrow$ boundedness $\neq$ continuity for nonlinear operators)

Theorem 11 (Brouwer fixed point theorem)**.** *Let $K \subset \mathbb{R}^N, N \in \mathbb{N}$ be a nonempty convex closed bounded. Assume that $F : K \to K$ is continuous. Then F has a fixed point in K, i.e.,*

$$\exists x_0 \in K : F(x_0) = x_0.$$

Proof. No proof □

Theorem 12 (Schauder fixed point theorem)**.** *Let $K \subset X$ be a nonempty convex closed bonded subset of a linear normed space X. Assume that F is compact on K into K and $F(K) \subset K$. Then there is fixed point of F in K.*

Proof. No proof □

- for Brouwer, $K \subset \mathbb{R}^N$ so since it is closed and bouded, it is automatically compact, and since $F : K \to K$ is continuous, F is compact. For Schauder, we have to assume this extra.
- proof of Brouwer with N=1 is easy, based on Darboux property.

3.0.1 Problem protypes

In this chapter some nonlinear elliptic equations are discussed.

Example. Suppose the following problem:

$$\begin{cases} -\triangle u + g(u) = f & \text{in}\,\Omega \\ u = 0 & \text{on}\,\partial\Omega, \end{cases}$$

where

$$g : \mathbb{R} \to \mathbb{R}, f \in \left(\mathrm{W}_0^{1,2}(\Omega)\right)^*, \text{continuous}\,, \exists \alpha \in [0,1) : \forall s \in \mathbb{R} : |g(s)| \le C(1 + |s|^\alpha).$$

Theorem 13 (Existence)**.** *Let $\Omega \in C^{1,1}, f \in \left(W_0^{1,2}(\Omega)\right)^*, g$ is as above. Then there is a weak solution to the above problem, i.e., it holds:*

$$\forall \varphi \in W_0^{1,2}(\Omega) : \int_\Omega \nabla u \cdot \nabla \varphi \,\mathrm{d}x = < f, \varphi >_{(W_0^{1,2}(\Omega))^*}\,.$$

If $f \in L_2(\Omega)$, then the solution $u \in W^{2,2}(\Omega)$.

Proof. We define $S : \mathrm{L}_2(\Omega) \to \mathrm{L}_2(\Omega)$ such that

$$Sw = u \Leftrightarrow \forall \varphi \in \mathrm{W}_0^{1,2}(\Omega) : \int_\Omega \nabla u \cdot \nabla \varphi \,\mathrm{d}x = < f, \varphi > - \int_\Omega g(w)\varphi \,\mathrm{d}x\,.$$

S is well defined:

$$|\,\mathrm{RHS}\,| \le \|f\|_{(\mathrm{W}_0^{1,2}(\Omega))^*}\|\varphi\|_{\mathrm{W}^{1,2}(\Omega)} + \|\varphi\|_{\mathrm{L}_2(\Omega)}\|g(w)\|_{\mathrm{L}_2(\Omega)},$$

and

$$\int_\Omega |g(w)|^2 \,\mathrm{d}x \le \int_\Omega C(1 + |w|^\alpha)^2 \,\mathrm{d}x \le \int_\Omega C\left(1 + |w|^{2\alpha}\right) \mathrm{d}x \le \int_\Omega C\left(1 + |w|^2\right) \mathrm{d}x \le \infty,$$

where we used the Young inequality and $\alpha \le 1$. We have thus shown the mapping $w \mapsto g(w)$ is continuous from $\mathrm{L}_2(\Omega)$ to $\mathrm{L}_2(\Omega)$ by Nemytskii. Next, S is continuous:

- $w \mapsto g(w)$ is continuous from $\mathrm{L}_2(\Omega)$ to $\mathrm{L}_2(\Omega)$
- $w \mapsto \left(\varphi \mathrm{W}_0^{1,2}(\Omega) \to < f, \varphi > - \int_\Omega g(w)\varphi \,\mathrm{d}x\right)$ is continuous from $\mathrm{L}_2(\Omega)$ to $\left(\mathrm{W}_0^{1,2}(\Omega)\right)^*$
- $F \to u$, where u is the weak solution of $\begin{cases} -\triangle u = F & in\Omega \\ u = 0 & on\partial\Omega, \end{cases}$, is linear and continuous from $(\mathrm{W}_0^{1,2}(\Omega))^*$ to $\mathrm{W}_0^{1,2}(\Omega)$.

In total, the composition is continuous and yields S. Next, we would like to show S is compact. We start with showing S maps bounded sets in $\mathrm{L}_2(\Omega)$ to bounded sets in $\mathrm{W}_0^{1,2}(\Omega)$; for that we need apriori estimates: test the weak formulation with u:

$$\|\nabla u\|^2_{\mathrm{L}_2(\Omega)} \le \varepsilon \|u\|^2_{\mathrm{W}^{1,2}(\Omega)} + C\Big(\|f\|^2_{(\mathrm{W}^{1,2}(\Omega))^*} + \|g(w)\|^2_{\mathrm{L}_2(\Omega)}\Big) \underbrace{\le}_{\text{Younge}} C\Big(\|f\|_{(\mathrm{W}_0^{1,2}(\Omega))^*)} + 1 + \|w\|^2_{\mathrm{L}_2(\Omega)}\Big),$$

from which follows S is compact from $\mathrm{L}_2(\Omega)$ to $\mathrm{L}_2(\Omega)$ by compact embedding. Now we need to show $S(\mathrm{U}(0,R)) \subset \mathrm{U}(0,R)$ for some $R>0$. From the previous we know:

$$\frac{C}{2}\|u\|^2_{\mathrm{W}^{1,2}(\Omega)} \le \tilde{C}\Big(\|f\|_{(\mathrm{W}^{1,2}_0(\Omega))^*} + \|g\|^2_{\mathrm{L}_2(\Omega)}\Big),$$

so since

$$\tilde{C}\int_\Omega |g(w)|^2\,\mathrm{d}x \le \int_\Omega C\big(1+|w|^{2\alpha}\big)\,\mathrm{d}x \underbrace{\le}_{\text{Younge}} \int_\Omega \Big(C + \frac{c}{4}|w|^2\Big)\,\mathrm{d}x$$

we know

$$\frac{c}{2}\|u\|^2_{\mathrm{L}_2(\Omega)} \le \frac{c}{2}\|u\|^2_{\mathrm{W}^{1,2}(\Omega)} \le \tilde{C}\|f\|^2_{(\mathrm{W}^{1,2}_0(\Omega))^*} + C\lambda(\Omega) + \frac{c}{4}\|w\|^2_{\mathrm{L}_2(\Omega)},$$

and thus

$$\|u\|^2_{\mathrm{L}_2(\Omega)} \le \underbrace{\frac{2\tilde{C}}{c}\|f\|^2_{(\mathrm{W}^{1,2}_0(\Omega))^*} + 2\frac{C}{c}}_{=\overline{C}} + \frac{1}{2}\|w\|^2_{\mathrm{L}_2(\Omega)}.$$

so if $\overline{C} + \frac{1}{2}R^2 < R^2$, we are done [3]. But such an R of course exists (says doc. Kaplicky) $\Rightarrow$ the image of a ball is in a ball for some $R \Rightarrow S$ is compact and using Schauder we get the solution exists.

For the regularity part of the assertion, realize that u_0 solves $\begin{cases} -\triangle u_0 = f - g(u_0) \in \mathrm{L}_2(\Omega) & \text{in } \Omega \\ u_0 = 0 & \text{on } \partial\Omega. \end{cases}$.
So from the regularity theory for elliptic equations we get

$$u \in \mathrm{W}^{2,2}(\Omega)\,.$$

□

Theorem 14 (Uniqueness)**.** *Let $u_1, u_2 \in W^{1,2}_0(\Omega)$ be weak solutions to the above problem. Let $f \in \big(W^{1,2}_0(\Omega)\big)^*$, g be continuous. Let either*

1. *g is nondecreasing*
2. *$g \in C^1(\mathbb{R})$, $\|g'\|_\infty$ small.*

Then $u_1 = u_2$.

Proof. We subtract the equations for u_1, u_2 and test with $u_1 - u_2$.:

$$\int_\Omega |\nabla(u_1-u_2)|^2 + (g(u_1)-g(u_2))(u_1-u_2)\,\mathrm{d}x = 0.$$

In the first case, the second term is nonnegative and so

$$0 = \|\nabla(u_1-u_2)\|_{\mathrm{L}_2(\Omega)} \ge C\|u_1-u_2\|^2_{\mathrm{W}^{1,2}(\Omega)} \Rightarrow u_1 - u_2 = 0.$$

$$\Big|\int_\Omega (g(u_1)-g(u_2)(u_1-u_2))\,\mathrm{d}x\Big| \le \int_\Omega \|g'\|_\infty |u_1-u_2|^2\,\mathrm{d}x \le \|g'\|_\infty C_P\|\nabla(u_1-u_2)\|^2_{\mathrm{L}_2(\Omega)} = 0 \Rightarrow u_1 = u_2.$$

whenever $C\|g'\|_\infty < 1$. □

[3] The constants are most probably messed up.

Example. Suppose the following problem

$$\begin{cases} -\triangle u + b(\nabla u) = f & \text{in}\,\Omega \\ u = 0 & \text{on}\,\partial\Omega. \end{cases}$$

where $f \in (\mathrm{W}_0^{1,2}(\Omega))^*, b$ is continuous and bounded. The weak formulation is

$$u \in \mathrm{W}_0^{1,2}(\Omega) \wedge \forall \varphi \in \mathrm{W}_0^{1,2}(\Omega) : \int_\Omega \nabla u \cdot \nabla \varphi + b(\nabla u)\varphi \,\mathrm{d}x =< f, \varphi >,$$

and the first apriori estimates (test with u)

$$\|\nabla u\|_{\mathrm{L}_2(\Omega)} \le \|f\|_{(\mathrm{W}_0^{1,2}(\Omega))^*} \|u\|_{\mathrm{W}_0^{1,2}(\Omega)} + \int_\Omega |u| \,\mathrm{d}x \,\|b\|_{\mathrm{L}_\infty(\Omega)}.$$

Theorem 15. *Let $f \in \left(W_0^{1,2}(\Omega)\right)^*, \Omega \in C^{0,1}, b : \mathbb{R}^d \to \mathbb{R}$ continuous and bounded. Then there is a weak solution to the above problem.*

Proof. $S : \mathrm{W}_0^{1,2}(\Omega) \to \mathrm{W}_0^{1,2}(\Omega)\,, Sw = u$ iff u solves

$$\begin{cases} -\triangle u = f - b(\nabla w) & \text{in}\,\Omega \\ u = 0 & \text{on}\,\partial\Omega. \end{cases}, \text{ i.e.}$$

it holds

$$\forall \varphi \in \mathrm{W}_0^{1,2}(\Omega) : \int_\Omega \nabla u \cdot \nabla \varphi \,\mathrm{d}x =< f, \varphi > - \int_\Omega b(\nabla w)\varphi \,\mathrm{d}x\,.$$

Clearly, S is well defined and

$$\|Sw\|_{\mathrm{W}_0^{1,2}(\Omega)} \le \underbrace{C\Big(\|f\|_{(\mathrm{W}_0^{1,2}(\Omega))^*} + \|b\|_{\mathrm{L}_\infty(\Omega)}\Big)}_{:=R},$$

meaning $S\Big(\overline{\mathrm{U}(0,R)}\Big) \subset \overline{\mathrm{U}(0,R)}$. Moreover, S]s continuous, as S is the composiiton of a Nemytskii operator and the solution operator of the Laplace equation. It remains to show S is compact: we already have continuity, consider $\{w_k\}_{k\in\mathbb{N}} \subset \mathrm{W}_0^{1,2}(\Omega)$ bounded. Then $\exists \{u_k\} \subset \mathrm{W}_0^{1,2}(\Omega)$ bounded: $u_k \to u$ in $\mathrm{L}_1(\Omega)$ by embedding up to a subsequence. Next, uss the following trick: substitue equation for u_k from equation for u_l and test with $u_l - u_k$

$$C\|u_l - u_k\|^2_{\mathrm{W}_0^{1,2}(\Omega)} \le \|\nabla(u_l - u_k)\|^2_{\mathrm{L}_2(\Omega)} \le \int_\Omega |b(\nabla u_l) - b(\nabla u_k)\,||u_l - u_k| \,\mathrm{d}x \le 2\|b\|_{\mathrm{L}_\infty(\Omega)}\|u_l - u_k\|_{\mathrm{L}_1(\Omega)}.$$

All in all, S has a fixed point by Schauder, which is of course the weak solution. □

But this says $\{u_k\}$ is Cauchy in $\mathrm{W}_0^{1,2}(\Omega)$.

4 Nonlinear elliptic equations - monotone operator theory

Lemma 9. *Let $g : B(0,R) \subset \mathbb{R}^n \to \mathbb{R}^N$ be continuous, $N \in \mathbb{N}, R > 0,$ and $\forall c \in S(0,R) : g(c) \cdot c \ge 0$. Then, there is $c_0 \in B(0,R) : g(c_0) = 0$.*

Proof. By contradiction. Let $g \neq 0$ in $\mathrm{U}(0,R)$. Let us define

$$h(x) = -R\frac{g(x)}{|g(x)|}.$$

Then $h \in C(\mathrm{B}(0,R)), h(\mathrm{B}(0,R)) \subset \mathrm{S}(0,R)$, so by Brouwer there $\exists x_0 \in \mathrm{B}(0,R) : h(x_0 = x_0 \Rightarrow -R\frac{g(x_0)}{|g(x_0)|} = x_0$. Take the dot product with x_0 and write

$$\underbrace{-R\frac{g(x_0)\cdot x_0}{|g(x_0)|}}_{\leq 0} = \underbrace{|x_0|^2}_{=R^2} \wedge x_0 \in \mathrm{S}(0,R),$$

so that is a contradiction. □

Consider the following problem:

$$\begin{cases} -\sum_{i=1}^d \partial_i(a_i(x,u(x),\nabla u(x)) + a_0(x,u(x),\nabla u(x))) = f(x) & \text{in}\,\Omega \\ u = u_0 & \text{on}\,\partial\Omega \end{cases}$$

The date are

- $\Omega \in C^{0,1}$,
- $a_i : \Omega \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}, i \in \{1,\dots,d\}$ are Caratheodory in x and $(u,\nabla u)$.
- *growth condition*: $\exists C > 0, r \in (1,\infty), h \in \mathrm{L}_{r'}(\Omega) : \forall i \in \{0,\dots,d\}$, for almost all $x \in \Omega, \forall z \in \mathbb{R}, \forall p \in \mathbb{R}^d : |a_i(x,z,p)| \leq C\left(|z|^{r-1} + |p|^{r-1}\right) + h(x)$,
- $f \in \left(\mathrm{W}_0^{1,r}(\Omega)\right)^*$,

and the unknown is $u : \Omega \to \mathbb{R}$.

Remark. The function $(u,p) \mapsto a_i(\cdot,u,p)$ is continuous from $(\mathrm{L}_r(\Omega))^{d+1}$ to $\mathrm{L}_{r'}(\Omega)$. by Nemystkii theorem.

Definition 6 (Coercivity)**.** We say that $\{a_i\}_{i=0}^d$ are coercive if $\exists C_1 > 0, C_2 \in \mathrm{L}_1(\Omega)$: a.e. $x \in \Omega, \forall (z,p) \in \mathbb{R}^{d+1}$:

$$\sum_{i=1}^d a_i(x,z,p)p_i + a_0(x,z,p) \geq C_1|p|^r - C_2(x), \text{ i.e. } a(x,z,p)\cdot p \geq C_1|p|^r - C_2(x)$$

Definition 7 (Monotonicity)**.** We say that $\{a_i\}_{i=0}^d = a$ is monotone if for almost all

$$x \in \Omega, \forall (z_1,p_1),(z_2,p_2) \in \mathbb{R}^{d+1} : (a(x,z_1,p_1) - a(x,z_2,p_2))\cdot(p_1-p_2) + (a_0(x,z_1,p_1) - a_0(x,z_2,p_2))\cdot(z_1-z_2) \geq 0.$$

Very similiarly we define strict monotonicity.

Definition 8 (Weak solution)**.** We say that $u \in \mathrm{W}^{1,r}(\Omega)$ is a weak solution to the above problem if

- $u = u_0$ in the sense of traces on $\partial\Omega$,

- $$\int_\Omega a(\cdot,u,\nabla u)\cdot\nabla\varphi + a_0(\cdot,u,\nabla u)\varphi \,\mathrm{d}x =< f,\varphi >, \forall \varphi \in \mathrm{W}_0^{1,r}(\Omega)\,.$$

Theorem 16 (Existence and uniqueness)**.** *Let $\Omega \in C^{0,1}, u_0 \in W^{1,r}(\Omega)\,, r \in (1,\infty), \{a_i\}_{i=1}^d$ be Caratheodory, coercive and m and let them also satisfy the growth conditions. Finally, let $f \in \left(W^{1,r}(\Omega)\right)^*$. Then, there is a weak solution to the problem. If, moreover, $\{a_i\}_{i=1}^d$ is strictly monotone, then the weak solution is unique.*

Proof. The strategy is the following:

1. Galerkin Approximation
2. uniform estimates
3. limit passage
4. identification of limits

One of the issues we will face is that nonlinearities may destroy weak convergence, see the below example.

Galerkin: Since $\mathrm{W}_0^{1,r}(\Omega)$ is separable $\Rightarrow \exists\{w_i\}_{i=1}^\infty$ that is a dense[4] linearly independent subset of $\mathrm{W}_0^{1,r}(\Omega)$. We search for $n \in \mathbb{N}$ such that

$$u^n(x) := u_0(x) + \sum_{j=1}^n \alpha_j^n w_j(x),$$

where $\alpha_j \in \mathbb{R}$ and u^n satisfy

$$\forall j \in \{1,\dots,n\} : \int_\Omega a(\cdot,u^n,\nabla u^n)\cdot\nabla w_j + a_0(\cdot,u^n,\nabla u^n)w_j \,\mathrm{d}x =< f, w_j > .$$

We claim such $\{\alpha_j\}_{j=1}^n \subset \mathbb{R}^n$ exist $\forall n \in \mathbb{N}$ by the previous lemma. We define a vector function

$$F(\alpha^n) := \{\int_\Omega a\cdot\nabla w_j + a_0 w_j \,\mathrm{d}x - < f, w_j >\}_{j=1}^n,$$

from Nemystkii $F : \mathbb{R}^n \to \mathbb{R}^n, F$ is continuous on $\mathbb{R}^n$. Moreover, it holds

$$F(\alpha^n)\cdot\alpha^n \geq \int_\Omega a(\cdot,u^n,\nabla u^n)\nabla(u^n-u_0)+a_0(u^n-u_0)\,\mathrm{d}x - < f, u^n-u_0 > \underbrace{\geq}_{\text{coercivity}} \int_\Omega C_1|\nabla u^n|^r - (C_2(\cdot) + |a||\nabla u_0| + |a_0||u_0|)\,\mathrm{d}$$

together with the fact

$$\|\nabla u^n\|_{\mathrm{L}_r(\Omega)}^r \geq \Big(|\|\nabla(u-u_0)\|_{\mathrm{L}_r(\Omega)} - \|\nabla u_0\|_{\mathrm{L}_r(\Omega)}\Big)^r \geq \|\nabla(u^n-u_0)\|_{\mathrm{L}_q(\Omega)}^r - \|\nabla u_0\|_{\mathrm{L}_r(\Omega)}^r \geq C\|u^n-u_0\|_{\mathrm{W}^{1,r}(\Omega)}^r - \|\nabla u_0\|_{\mathrm{L}_r(\Omega)}^r,$$

Next, realize that $\alpha^n \in \mathbb{R}^n \mapsto \|u^n-u_0\|_{\mathrm{W}^{1,r}(\Omega)}$ is a norm equivalent to $|\alpha^n|$ (Euclidian norm). So that means $\exists K_1(n) > 0 : \forall \alpha \in \mathbb{R}^n : K_1(n)|\alpha^n| \leq \|u^n-u_0\|_{\mathrm{W}^{1,r}(\Omega)}$. For $|\alpha^n| = R, R > 0$ determined later estimate $F(\alpha^n)\cdot\alpha^n \geq c\|u^n-u_0\|_{\mathrm{W}^{1,r}(\Omega)} - \tilde{c}\Big(\|\nabla u_0\|_{\mathrm{L}_r(\Omega)}^r + 1 + \|u_0\|_{\mathrm{L}_r(\Omega)}^r + \|f\|_{(\mathrm{W}_0^{1,r}(\Omega))^*}^{r'}\Big)$ (which

[4] It can be chosen such that it is itself dense, not only its span

is not a trivial computation). And so $\exists R > 0, \forall \alpha^n \in \mathrm{S}(0,R) \subset \mathbb{R}^n : F(\alpha^n) \cdot \alpha^n > 0$, so from the previous lemma $\exists \alpha^n \in \mathrm{S}(0,R) : F(\alpha^n) = 0$, and we fix these α^n.

Uniform estimates They follow from the previous manipulation:

$$\|u^n - u_0\|^r_{\mathrm{W}^{1,r}(\Omega)} \le C\Big(1 + \|u_0\|^r_{\mathrm{W}^{1,r}(\Omega)} + \|f\|_{(\mathrm{W}^{1,r}(\Omega))^*}\Big),$$

and

$$\|u^n\|_{\mathrm{W}^{1,r}(\Omega)} \le C\Big(1 + \|u_0\|^r_{\mathrm{W}^{1,r}(\Omega)} + \|f\|_{(\mathrm{W}^{1,r}(\Omega))^*}\Big),$$

$$\forall j \in \{0,\dots,d\} : \|a_j(\cdot,u^n,\nabla u^n)\|^r_{\mathrm{L}_{r'}(\Omega)}{}' \le C\Big(1 + \|u_0\|^r_{\mathrm{W}^{1,r}(\Omega)} + \|f\|_{(\mathrm{W}^{1,r}(\Omega))^*}\Big),$$

Limit passage From the separability of the spaces, we can extract sequences (not renamed):

$$u^n \rightharpoonup u \,\mathrm{in}\, \mathrm{W}^{1,r}(\Omega)\,, a_j \rightharpoonup \alpha_j \,\mathrm{in}\, \mathrm{L}_{r'}(\Omega)\,.$$

We pass to the limit in the estimates and are able to write:

$$\forall j \in \mathbb{N} : \int_\Omega \alpha \cdot \nabla w_j + \alpha_0 w_j \,\mathrm{d}x =< f, w_j >,$$

and from density of $\{w_j\}_{j\in\mathbb{N}}$ in $\mathrm{W}^{1,r}(\Omega)$ we have

$$\forall \varphi \in \mathrm{W}^{1,r}_0(\Omega) : \int_\Omega \alpha \cdot \nabla\varphi + \alpha_0\varphi \,\mathrm{d}x =< f.\varphi >\,.$$

Identification of α's We want to show $\alpha_j = a_j(\cdot,u,\nabla u), j \in \{0,\dots,d\}$. For that, we use the *Minty trick*:

$$\begin{aligned}
0 &\le \int_\Omega (a(\cdot,u^n,\nabla u^n) - a(\cdot,v,V)) \cdot (\nabla u^n - V) + (a_0(\cdot,u^n,\nabla u^n) - a_0(\cdot,v,V)) \cdot (u^n - v) \\
&\le \int_\Omega a(\cdot,u^n,\nabla u^n) \cdot \nabla u^n + a_0(\cdot,u^n,\nabla u^n) \cdot u^n \,\mathrm{d}x + \\
&- \int_\Omega (a(\cdot,u^n,\nabla u^n)V + a_0(\cdot,u^n,\nabla u^n)v - a(\cdot,v,V) + a_0(\cdot,v,V) \cdot (u^n - v)) \,\mathrm{d}x\,.
\end{aligned}$$

Denote

$$I^n = \int_\Omega a(\cdot,u^n,\nabla u^n) \cdot \nabla(u^n - u_0) + a_0(\cdot,u^n,\nabla u^n) \cdot (u^n - u_0)) \,\mathrm{d}x + \int_\Omega a(\cdot,u^n,\nabla u^n) \cdot u_0 + a_0(\cdot,u^n,\nabla u^n) u_0 \,\mathrm{d}x\,,$$

by using the equation we obtain

$$I^n =< f, u^n - u_0 > + \int_\Omega a(\cdot,u^n,\nabla u^n) \cdot u_0 + a_0(\cdot,u^n,\nabla u^n) u_0 \,\mathrm{d}x \to < f, u - u_0 > + \int_\Omega \alpha\nabla u_0 + \alpha_0 u_0 \,\mathrm{d}x = \int_\Omega \alpha\nabla u + \alpha_0 u \,\mathrm{d}x\,,$$

as the rest has subtracted. In total, we have

$$0 \le \int_\Omega (\alpha - a(\cdot,v,V)) \cdot (\nabla u - V) + (\alpha_0 - a_0(\cdot,v,V))(u - v) \,\mathrm{d}x\,.$$

So far, v, V have been arbitrary. If we take

$$V = \nabla u - \lambda\psi, \psi \in \mathrm{L}_r(\Omega)\,, v = u,$$

then $0 \leq \int_\Omega (\alpha - a(\cdot, \nabla u + \lambda\psi))\lambda\psi \,\mathrm{d}x$, so if we take $\lambda > 0$ and pass to the limit $\lambda \to 0_+$ (using Nemytskii theorem) we can write

$$0 \leq \int_\Omega (\alpha - a(\cdot, u, \nabla u))\psi \,\mathrm{d}x .$$

Since ψ was arbitrary, we could have taken $\psi \to -\psi$, which in total means

$$0 = \int_\Omega (\alpha - a(\cdot, u, \nabla u))\psi \,\mathrm{d}x$$

Finally, from the previous results, we obtain

$$\forall \varphi \in \mathrm{W}_0^{1,r}(\Omega) : \int_\Omega a(\cdot, u, \nabla u)\nabla\varphi + a_0(\cdot, u, \nabla u)\varphi \,\mathrm{d}x =< f, \varphi >,$$

and we are almost done. It only remains to show the traces are correct, bt since $u^n \rightharpoonup u$ in $\mathrm{W}^{1,r}(\Omega)$ and from the continuity of the traces, we obtain

$$\operatorname{tr} u = \operatorname{tr} u_0.$$

Uniqueness: Let u_1, u_2 be two solutions. Use strict monotonicity, subtract the weak formulation and test with $u_2 - u_1$:

$$\int_\Omega (a(\cdot, u_2, \nabla u_2) - a(\cdot, u_1, \nabla u_1)) \cdot \nabla(u_2 - u_1) + \underbrace{(a_0(\cdot, u_2, \nabla u_2) - a_0(\cdot, u_1, \nabla u_1))(u_2 - u_1)}_{:=T} \,\mathrm{d}x = 0,$$

where $T \geq 0$, so from strict monotonicity we obtain $T = 0$ a.e. in Ω but that means $u_1(x) = u_2(x) \wedge \nabla u_1(x) = \nabla u_2(x)$, a.e. in $\Omega \Rightarrow u_1 = u_2$ in $\mathrm{W}^{1,r}(\Omega)$. □

Example (Nonlinearities vs weak convergence)**.** Let $g_n(x) = \sin(nx)$, then $g \rightharpoonup 0$ in $\mathrm{L}_2((0,4))$ (Riemann-Lebesgue lemma). However,

$$\int_0^4 \sin^2(nx)\varphi \,\mathrm{d}x \geq \int_2^4 \sin^2(nx) \,\mathrm{d}x \to \frac{1}{2} \neq 0, \forall \varphi \in \mathrm{L}_2((0,4)) ,$$

so $\{u_n^2\} = \{\sin^2(nx)\}$ **does not converge weakly to** $0 = 0^2$.

Remark. The method of the presented proof is ***very important.***

5 Exercises

5.1 4.3.2025

Example (Coefficients for smooth extension)**.** Define

$$Eu(x', x_d) = u(x', x_d), x \geq 0, = \sum_{j=1}^{k+1} u\left(x', -\frac{x_d}{j}\right)c_j, x_d < 0.$$

for $u \in \mathcal{D}(\mathbb{R}^d)$. Find $\{c_j\}_{j=1}^{k=1}$ in such a way that $Eu \in C^k(\mathbb{R}^d)$. Moreover, take $d = 1$.

Proof. For $k = 0, j = 1$ we take $c_1 = 1, c_j = 0, j \neq 1$. For $k = 1$, compute the derivative:

$$\partial_{d^n} Eu(x', x_d) = \partial_{d^n} u(x', x_d), x_d \geq 0, = \sum_{j=1}^{k=1} (-1)^n \frac{\partial_{d^n} u\left(x', \frac{x_d}{j}\right)}{j^n} c_j, x_d < 0.$$

If we take $x_d = 0$ in particular:

$$\partial_{d^n} u(x', 0) = \sum_{j=1}^{k+1} \partial_{d^n} u(x', 0)\left(-\frac{1}{j}\right)^n c_j \Leftrightarrow 1 = \sum_{j=1}^{k+1} c_j \left(-\frac{1}{j}\right)^n, \forall n \in \{0, \dots, k\}.$$

That is a linear system of $k + 1$ equations. Is it solvable? □

5.2 8.4.2025

Example (Laplace)**.** Let $a_0 = 0, a(\cdot, z, p) = p$. Then $|a(\dots)| \leq |p|$,growth can be accomplished for $r = 2$, $a(\dots) \cdot p \geq |p|^2$. We can thus apply the theorem to our laplace equation

Example. Let $a_0 = 0, a(\cdot, z, p) = p \operatorname{atan}\left(1 + |p|^2\right)$. Then it is clearly Caratheodory, it is bounded $|a(\dots)| \leq |p|\frac{\pi}{2}$, so the growth conditions yield, it is coercive as $\operatorname{atan}\left(1 + |p|^2\right) \geq \frac{\pi}{4}|p|^2$, and it is monotone

$$\left(\operatorname{atan}\left(1 + |p_1|^2\right)p_1 - \operatorname{atan}\left(1 + |p_2|^2\right)p_2\right)(p_1 - p_2) = \int_0^1 \sum_{j=1}^{d} \frac{\mathrm{d}}{\mathrm{d}s} \operatorname{atan}\left(1 + |p_2 + s(p_1 - p_2)|^2\right)(p_2 + s(p_1 - p_2))\,\mathrm{d}s\,(p_1 - p_2)_j$$
