1 Winter semester addendum

1.1 Weak* convergence

Since $L_{\infty}(0,T); L_{2}(\Omega)$ is not reflexive, we cannot extract a (weakly) convergent subsequence; however, we know the predual of $L_{\infty}(0,T); L_{2}(\Omega)$ is reflexive, i.e.

$$L_{\infty}((0,T);L_2(\Omega)) \cong (L_1((0,T);L_2(\Omega)))^*,$$

which means that balls in $L_{\infty}((0,T);L_2(\Omega))$ are weakly* compact. Moreover, $L_1((0,T);L_2(\Omega))$ is separable, from which it follows $L_{\infty}((0,T);L_2(\Omega))$ with the weak* topology is metrizable and thus there exists s weakly * converging subsequence (from the balls).

Example (For people without Functional Analysis I). Let X be a linear normed space, $\{x_n\} \subset X$ a sequence in X. We say x_n converges weakly to $x \in X$ whenever

$$f(x_n) \to f(x), \forall f \in X^*$$
.

Let X* be the topological dual to X, $\{x_n\} \subset X^*$ a sequence in X. We say f_n converges weakly* to $f \in X^*$ whenever

$$f_n(x) \to f(x), \forall x \in X^*, i.e. x(f_n) \to x(f),$$

where by $x(y), x \in X, y \in X.*$ we understand

$$\varepsilon_x: X^* \to \mathbb{K}, y \mapsto y(x).$$

Since $L_{\infty}((0,T);L_2(\Omega)) \cong (L_1((0,T);L_2(\Omega)))^*$, every point $x \in L_{\infty}((0,T);L_2(\Omega))$ can be interpreted as a linear functional on $L_1((0,T);L_2(\Omega))$, so given $\{x_n\} \subset L_{\infty}((0,T);L_2(\Omega))$, we can interpret is as a $\{x_n\} \subset (L_1((0,T);L_2(\Omega)))^*$, meaning given a weakly converging sequence in $L_{\infty}((0,T);L_2(\Omega))$, it is actually a weakly* converging sequence in $L_1((0,T);L_2(\Omega))$.

1.2 Regularity of parabolic problems

Theorem 1. Let the assumptions of the previous theorem hold and $\Omega \in C^{1,1}, \delta \in (0,1)$. Then $u \in L_2((\delta,T); W^{2,2}(\Omega))$.

Proof. Take the weak formulation in $t \in (\delta, T)$. WLOG further assume d = 0. Then

$$\int_{\Omega} \mathbb{A} \nabla u \cdot \nabla \varphi = \int_{\Omega} f \varphi - bu \varphi - \mathbf{c} \cdot \nabla u \varphi - \int_{\Omega} \partial_t u \varphi = \int_{\Omega} (f - bu - \mathbf{c} \cdot \nabla u - \partial_t u) \varphi,$$

and the integrand of the last integral is in $L_2(\Omega)$ for a.e. $t \in (\delta, T)$. We can thus use the elliptic regularity results and write:u

$$\|u\|_{W^{2,2}(\Omega)}^2 \le C(\|f\|_{L_2(\Omega)}^2 + \|u\|_{W^{1,2}(\Omega)}^2 + \|\partial_t u\|_{L_2(\Omega)}^2),$$

integrating both sides $\int_{\delta}^{T} dt$ yields

$$||u||_{L_2((\delta,T);L_2(\Omega))}^2 \le C(||f||_{L_2(\Omega)}^2 + ||u||_{L_2((0,T);W^{1,2}(\Omega))}^2 + ||u||_{L_2((\delta,T);L_2(\Omega))}^2)$$

Theorem 2. If data are smooth and satisfy the compatibility conditions, then the weak solutions to the parabolic equation are smooth.

Proof. no.
$$\Box$$

Remark (Compatibility condition). : Take the heat equation : $\partial_t u - \triangle u = f$ at time zero: $\triangle u(0) + f(0) = \partial_t u(0) \in W_0^{1,2}(\Omega)$, so we need that $f(0) + \triangle u(0)$ has zero trace \Rightarrow compatibility conditions.

1.3 Uniqueness of solutions to hyperbolic problems

Theorem 3 (Uniqueness of the solution to a hyperbolic equation). Let the assumptions on the data of the hyperbolic equations be standard (i.e. minimal). Further assume that $\mathbf{c} \in W^{1,\infty}(\Omega)$. Then the weak solution to the hyperbolic equation is unique.

Proof. It is enough that if $u_0 = 0$, $u_1 = 0 \Rightarrow u = 0 \in Q_T$. To do that, take the equation, multiply it by $\varphi \in V$ fixed and integrate over Ω for $t \in (0,T)$ fixed:

$$<\partial_{tt}u(t), \varphi>+\int_{\Omega}\mathbb{A}(t)\nabla u(t)\cdot\nabla\varphi\,\mathrm{d}x+\int_{\Omega}\big(bu(t)+\mathbf{c}\cdot\nabla u(t)\big)\varphi\,\mathrm{d}x-\int_{\Omega}u(t)\mathbf{d}(t)\cdot\nabla\varphi\,\mathrm{d}x=0.$$

Now, take a special test function

$$\psi(t) = \left(\int_t^s u(\tau) \,\mathrm{d}\tau\right) \chi_{(0,s)}(t),$$

for some $s \in (0,T)$. Then $\partial_t \psi(t) = -u(t)$ on $t \in (0,s)$. Next, integrate the equation in time over (0,s).

$$\int_0^s \langle \partial_{tt} u(t), \psi \rangle dt + \int_0^s \int_{\Omega} \mathbb{A}(t) \nabla u(t) \cdot \nabla \psi dx dt + \int_0^s \int_{\Omega} (bu(t) + \mathbf{c} \cdot \nabla u(t)) \psi dx dt - \int_0^s \int_{\Omega} u(t) \mathbf{d}(t) \cdot \nabla \psi dx dt = 0,$$

Now use per partes on the first term (deploy Gelfand triple):

$$\int_0^s \langle \partial_t u(t), \varphi \rangle dt = \langle \partial_t u(s), \psi(s) \rangle - \langle \partial_t u(0), \psi(0) \rangle - \int_0^s \langle \partial_t u(t), \partial_t \psi(t) \rangle dt,$$

and realize $\psi(s) = 0, \partial_t u(0) = 0$, so

$$-\int_0^s \langle \partial_t u(t), \partial_t \psi(t) \rangle dt + \int_0^s \int_{\Omega} \mathbb{A}(t) \nabla u(t) \cdot \nabla \psi dx dt + \int_0^s \int_{\Omega} (bu(t) + \mathbf{c} \cdot \nabla u(t)) \psi dx dt - \int_0^s \int_{\Omega} u(t) \mathbf{d}(t) \cdot \nabla \psi dx = 0,$$

but since $\partial_t \psi(t) = -u(t)$, we can actually write (time dependencies are omitted for brevity)

$$\int_0^s \langle \partial_t u, u \rangle dt + \int_0^s \int_{\Omega} -\mathbb{A} \nabla \partial_t \psi \cdot \nabla \psi - b\psi \partial_t \psi - \psi \mathbf{c} \cdot \nabla \partial_t \psi + \partial_t \psi d\mathbf{c} \cdot \nabla \psi d\mathbf{x} dt = 0,$$

rewriting the LHS as a time derivative of something, we obtain

$$\frac{1}{2} \int_{0}^{s} \frac{\mathrm{d}}{\mathrm{d}t} \left(\|u\|_{L_{2}(\Omega)}^{2} - \int_{\Omega} \mathbb{A} \nabla \psi \cdot \nabla \psi + b\psi^{2} + \psi \mathbf{c} \cdot \nabla \psi + \psi \mathbf{d} \cdot \nabla \psi \, \mathrm{d}x \right) \mathrm{d}t =$$

$$= \int_{0}^{s} \int_{\Omega} (\partial_{t} \mathbb{A}) \nabla \psi \cdot \nabla \psi + \partial_{t} b\psi^{2} + \psi \partial_{t} \mathbf{c} \cdot \nabla \psi + \underbrace{\partial_{t} \psi}_{=-u(t)} \mathbf{c} \cdot \nabla \psi - \psi \partial_{t} \mathbf{d} \cdot \nabla \psi - \psi \mathbf{d} \cdot \nabla \underbrace{\partial_{t} \psi}_{=-u(t)} \right) \mathrm{d}t \, \mathrm{d}x ,$$

and upon integration (recall $\psi(s) = 0$, from the definition of ψ it follows $\nabla \psi(0) = 0$, and u(0) = 0,

$$\frac{1}{2} \left(\|u(s)\|_{\mathbf{L}_{2}(\Omega)}^{2} + \int_{\Omega} \mathbb{A}(0) \nabla \psi(0) \cdot \nabla \psi(0) + b(0) \psi(0)^{2} + \psi(0) \mathbf{c}(0) \cdot \nabla \psi(0) + \psi(0) \mathbf{d}(0) \nabla \psi(0) \, \mathrm{d}x \right) =$$

$$= \int_{0}^{s} \int_{\Omega} \partial_{t} \mathbb{A} \nabla \psi \cdot \nabla \psi + \partial_{t} b \psi^{2} - u \partial_{t} \mathbf{c} \cdot \nabla \psi - \psi \partial_{t} \mathbf{d} \cdot \nabla \psi + \psi \mathbf{d} \cdot \nabla u \, \mathrm{d}x \, \mathrm{d}t.$$

From this we obtain the following estimate:

$$\|u(s)\|_{L_{2}(\Omega)}^{2} + \|\psi(0)\|_{W^{1,2}(\Omega)}^{2} \leq C \left(\int_{0}^{s} \|\psi\|_{W^{1,2}(\Omega)}^{2} + \|u\|_{L_{2}(\Omega)}^{2} \right) dt + \|\psi(0)\|_{L_{2}(\Omega)}^{2},$$

where $C = C(\|\mathbb{A}\|_{\mathcal{L}_{\infty}(\Omega)}, \|\partial_{t}\mathbb{A}\|_{\mathcal{L}_{\infty}(\Omega)}, \|b\|_{\mathcal{L}_{\infty}(\Omega)}, \|\partial_{t}b\|_{\mathcal{L}_{\infty}(\Omega)}, \|\mathbf{c}\|_{\mathcal{L}_{\infty}(\Omega)}, \|\partial_{t}\mathbf{c}\|_{\mathcal{L}_{\infty}(\Omega)}, \|\mathbf{d}\|_{\mathcal{L}_{\infty}(\Omega)}, \|\partial_{t}\mathbf{d}\|_{\mathcal{L}_{\infty}(\Omega)}).$ Define now the test function $\chi(t) = \int_{0}^{t} u(\tau) d\tau$, and realize that in fact $\psi(t) = \chi(s) - \chi(t), \chi(0) = 0$. Plugging this in the above inequalty yields

$$\|u(s)\|_{L_{2}(\Omega)}^{2} + \|\chi(s)\|_{L_{2}(\Omega)}^{2} \leq C\left(\int_{0}^{s} \|\chi(s) - \chi(t)\|_{W^{1,2}(\Omega)}^{2} + \|u\|_{L_{2}(\Omega)}^{2}\right) + \|\chi(s)\|_{L_{2}(\Omega)}^{2},$$

and using

$$\|\chi(s) - \chi(t)\|_{\mathbf{W}^{1,2}(\Omega)}^2 = \|\chi(t) - \chi(s)\|_{\mathbf{W}^{1,2}(\Omega)}^2 \le 2(\|\chi(t)\|_{\mathbf{W}^{1,2}(\Omega)}^2 + \|\chi(s)\|_{\mathbf{W}^{1,2}(\Omega)}^2),$$

and the definition of $\chi(t)$, from which it follows

$$\|\chi(s)\|_{L_2(\Omega)}^2 \le \int_0^s \|u\|_{L_2(\Omega)}^2 dt$$
,

we are allowed to write

$$\|u(s)\|_{\mathcal{L}_{2}(\Omega)}^{2} + \|\chi(s)\|_{\mathcal{L}_{2}(\Omega)}^{2} \le C \left(\int_{0}^{s} 2\|\chi(s)\|_{\mathcal{W}^{1,2}(\Omega)}^{2} + 2\|\chi(t)\|_{\mathcal{W}^{1,2}(\Omega)}^{2} + 2\|u\|_{\mathcal{L}_{2}(\Omega)}^{2} dt \right),$$

and so

$$\|u(s)\|_{L_{2}(\Omega)}^{2} + (1 - 2sC)\|\chi(s)\|_{W^{1,2}(\Omega)}^{2} \le C_{1}\left(\int_{0}^{s} \|\chi(t)\|_{W^{1,2}(\Omega)}^{2} + \|u(t)\|_{L_{2}(\Omega)}^{2} dt\right).$$

If we now choose $T_1 \in (0,T]$ small enough s.t. 1-2sC > 0 for $s \in (0,T_1]$, we finally obtain

$$\|u(s)\|_{\mathrm{L}_2(\Omega)}^2 + \|\chi(s)\|_{\mathrm{W}^{1,2}(\Omega)}^2 \leq C_2 \left(\int_0^s \|\chi(t)\|_{\mathrm{W}^{1,2}(\Omega)}^2 + \|u(t)\|_{\mathrm{L}_2(\Omega)}^2 \, \mathrm{d}t \right), \forall s \in (0,T_1],$$

which implies u = 0 on $(0, T_1]$ by the Gronwall lemma: we have

$$\xi(t) \le \int_0^t \xi(s) \, \mathrm{d}s$$
, for $a.a.t \in (0,T) \Rightarrow \xi(t) = 0$ $a.e.$.

for $\xi \in L_1((0,T))$ nonnegative¹. If we now boostrap on $[T_1, 2T_1], [2T_1, 3T_1]$ etc., we obtain u = 0 on (0,T].

$\mathbf{2}$ Sobolev spaces revisited

Let $\Omega \subset \mathbb{R}^d$ open, $p \in [1, +\infty], k \in \mathbb{N}$. We define

$$\mathbf{W}^{\mathrm{k,p}}(\Omega) = \Big\{ f \in \mathbf{L}_{\mathrm{p}}(\Omega) \, ; D^{\alpha} f \in \mathbf{L}_{\mathrm{p}}(\Omega) \, , \, \forall |\alpha| \leq k \Big\},$$

with the norm

$$\|f\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)}^p = \|f\|_{\mathbf{L}_{\mathbf{p}}(\Omega)}^p + \sum_{0<|\alpha|\leq k} \|D^{\alpha}f\|_{\mathbf{L}_{\mathbf{p}}(\Omega)}^p.$$

Recall that:

- $W^{k,p}(\Omega)$ is Banach $\forall p$ and Hilbert for p = 2.
- $W^{k,p}(\Omega)$ is separable if $p < \infty$ and reflexive if $p > 1, p < \infty$.

Our goal will be to prove embedding and trace theorems. We will use the density of smooth functions.

2.1 Tools from functional analysis

Definition 1 (Regularization kernel). The function η is called the regularization kernel supposed:

- $\eta \in \mathcal{D}(\mathbb{R}^d)$
- supp $\eta \in U(0,1)$
- $\eta \ge 0$
- η is radially symmetric
- $\int_{\mathbb{R}^d} \eta(x) \, \mathrm{d}x = 1$

[•] $\int_{\mathbb{R}^d} \eta(x) dx = 1$ ¹In our case $\xi = ||u||_{L_2(\Omega)}^2 + ||\chi||_{W^{1,2}(\Omega)}^2$.

Definition 2 (Regularization of a function). Let η be a regularization kernel. Set²

$$\eta_{\varepsilon}(x) = \frac{1}{\varepsilon^d} \eta(x/\varepsilon), \varepsilon > 0.$$

We define the smoothing of $f \in L_1(\Omega)_{loc}$ by

$$f_{\varepsilon}(x) = (f \star \eta_{\varepsilon})(x).$$

Remark (Properties of regularization). The regularization has the following properties:

- $f \in L_p(\Omega) \Rightarrow f_{\varepsilon} \to f \operatorname{in} L_p(\Omega)$ and also a.e
- $f \in L_{\infty}(\Omega) \Rightarrow f_{\varepsilon} \to f$ a.e and *-weak
- $f_{\varepsilon}(x) = \int_{\mathbb{R}^d} f(y) \eta_{\varepsilon}(x y) \, dy = \int_{\mathrm{U}(x,\varepsilon)} f(y) \eta_{\varepsilon}(x y) \, dy$
- supp $f_{\varepsilon} \subset \overline{U(\Omega, \varepsilon)}, f = 0 \text{ on } U(x, \varepsilon) \Rightarrow f_{\varepsilon}(x) = 0$

Definition 3 $(\Omega' \subset \subset \Omega)$. $O \subset \subset \Omega$ means \overline{O} is compact and $\overline{O} \subset \Omega$.

Definition 4 (Shift operator). For $u \in L_p(\Omega)$, $k \in \{1, ..., d\}$, h > 0, we introduce the shift operator

$$\tau_h u(x) = u(x + h\mathbf{e}_k)$$

Lemma 1 (Approximation property of the shift operator). For $u \in L_p(\Omega)$, it holds $\tau_h u \to u$ in $L_p(\Omega)$, $h \to 0^+$.

Lemma 2 (Partition of unity). Let $E \subset \mathbb{R}^d$, \mathcal{G} be an open covering of E (possibly uncountable.) Then there exists a countable system \mathcal{F} of nonnegative functions $\varphi \in \mathcal{D}(\mathbb{R}^d)$ such that $0 \le \varphi \le 1$ and

- 1. \mathcal{F} is subordinate to $\mathcal{G}: \forall \varphi \in \mathcal{F} \exists U \in \mathcal{G}: \operatorname{supp} \varphi \subset U$
- 2. \mathcal{F} is locally finite³: $\forall K \subset E$ compact, $\operatorname{supp} \varphi \cap K \neq \emptyset$ for at most finitely many $\varphi \in \mathcal{F}$.
- 3. $\sum_{\varphi \in \mathcal{F}} \varphi(x) = 1, \forall x \in E$.

Proof. (Sketch) Step 1 (If E is compact):

 $E \text{ compact} \Rightarrow \exists m \in \mathbb{N} : \exists U_j \in \mathcal{G} \text{ s.t. } E \subset \bigcup_{j=1}^m U_j$. Moreover, $\exists K_j \subset U_j$ compact such that $E \subset \bigcup_{j=1}^m K_j$. That follows from the exhaustion argument: for $U \subset \mathbb{R}^d$ open, you can approximate it by a compact set:

$$K_m = \left\{ x \in U | \operatorname{dist}(x, \partial \Omega) \ge \frac{1}{m}, ||x|| \le m \right\}.$$

Then clearly $K_1 \subset K_2 \ldots$, and they "converge monotonously to U. Next, find $\phi_j \in C_c(U_j), \phi_j > 0$ on K_j , e.g. $\phi_j = \theta(\operatorname{dist}(x, \partial U_j))$. Then use convolution: $\psi_j = (\phi_j)_{\varepsilon}, \varepsilon > 0$ small and take finally

$$\varphi_j = \frac{\psi_j}{\sum_k \psi_k}.$$

Step 2 (If E is open):

Approximate E by $K \subset E$ compact by the exhaustion argument, then the covering will enlarge from finite \rightarrow countable (nontrivial reasoning).

²Another common choice is $\eta_k = k^d \eta(kx), k \in \mathbb{N}$.

³In other words, φ_K is nonzero for at most finitely many $\varphi \in \mathcal{F} \Leftrightarrow \text{points in } K$ can be represented by finitely many functions $\varphi \in \mathcal{F}$.

2.2 Density of smooth functions

Lemma 3 (Local approximation by smooth functions (using regularization)). Assume $p \in [1, \infty), \Omega \subset \mathbb{R}^d$ open, $k \in \mathbb{N}, u \in W^{k,p}(\Omega), \Omega_{\varepsilon} = \{x \in \Omega | \operatorname{dist}(x, \partial\Omega) > \varepsilon\}$. Then it holds

1.
$$D^{\alpha}(u_{\varepsilon}) = (D^{\alpha}u)_{\varepsilon}$$
 a.e. in $\Omega_{\varepsilon}, \forall |\alpha| \le k$

2.
$$u_{\varepsilon} \to u$$
 in $W^{k,p}(\Omega)_{loc}$, $\varepsilon \to 0^+$

Proof. First of all:

$$\forall x \in \Omega : D^{\alpha}(u_{\varepsilon}(x)) = D^{\alpha}\left(\int_{\mathbb{R}^d} u(y)\eta_{\varepsilon}(x-y) \, \mathrm{d}y\right) = \int_{\mathbb{R}^d} u(y)D_x^{\alpha}\eta_{\varepsilon}(x-y) \, \mathrm{d}y = \int_{\Omega} u(y)D_x^{\alpha}\eta_{\varepsilon}(x-y) \, \mathrm{d}y,$$

the integrable majorants are e.g. $\|\eta_{\varepsilon}\|_{\infty}|u|\chi_{\mathrm{U}(0,\varepsilon)}(x) \in \mathrm{L}_{1}(\Omega)$. Now picking $x \in \Omega_{\varepsilon}$ we realize $\forall y \in \mathbb{R}^{d}/\Omega : x - y \geq \mathrm{dist}(x,\partial\Omega) \geq \varepsilon$, and so $\eta_{\varepsilon}(x - y) = 0$. Exchanging derivatives and using the definition of the weak derivative

$$\int_{\Omega} u(y) D_x^{\alpha} \eta_{\varepsilon}(x-y) \, \mathrm{d}y = (-1)^{|\alpha|} \int_{\Omega} u(y) D_y^{\alpha} \eta_{\varepsilon}(x-y) \, \mathrm{d}y = \int_{\Omega} D_y^{\alpha} u(y) \eta_{\varepsilon}(x-y) \, \mathrm{d}y = \int_{\mathbb{R}^d} D_y^{\alpha} u(y) \eta_{\varepsilon}(x-y) \, \mathrm{d}y = (D^{\alpha}u)_{\varepsilon}.$$

Take $V \subset\subset \Omega$ open, then

$$||u - u_{\varepsilon}||_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(V)} = \sum_{|\alpha| \le k} ||D^{\alpha}u - D^{\alpha}u_{\varepsilon}||_{\mathbf{L}_{\mathbf{p}}(V)} \to 0,$$

because $D^{\alpha}u_{\varepsilon} = (D^{\alpha}u)_{\varepsilon} \to D^{\alpha}u$ in $L_{p}(V)$, from the properties of regularization.

Theorem 4 (Global approximation by smooth functions). Let $\Omega \subset \mathbb{R}^d$ be open, $k \in \mathbb{N}, p \in [1, \infty)$. Then $C = \{ f \in C^{\infty}(\Omega), \text{supp } f \text{ bounded} \} \cap W^{k,p}(\Omega) \text{ is dense in } W^{k,p}(\Omega), \text{ i.e.}$

$$\overline{C \cap W^{k,p}(\Omega)}^{\|\cdot\|_{W^{k,p}(\Omega)}} = W^{k,p}(\Omega).$$

If moreover Ω is bounded, it holds:

$$\overline{C^{\infty}(\Omega) \cap W^{k,p}(\Omega)}^{\|\cdot\|_{W^{k,p}(\Omega)}} = W^{k,p}(\Omega).$$

Proof. Let $u \in W^{k,p}(\Omega)$, $\varepsilon > 0$. I want to show $\exists v \in C^{\infty}(\Omega) \cap W^{k,p}(\Omega)$ s.t. $||u - v||_{W^{k,p}(\Omega)} < \varepsilon$. For every $j \in \mathbb{N}$ define an open set

$$\Omega_j = \left\{ x \in \Omega, \operatorname{dist}(x, \partial \Omega) > \frac{1}{i} \right\}.$$

Clearly, $\Omega_i \subset \Omega_{j+1} \, \forall j \in \mathbb{N}, \bigcup_{j=1}^{\infty} \Omega_j = \Omega$. Next, set

$$U_j = \Omega_{j+1} / \overline{\Omega_{j-1}}, j = 1, 2, \dots,$$

where $\Omega_0 = \Omega_{-1} = \emptyset$. Since Ω_j are open, U_j are also open and $\Omega \subset \bigcup_{j \in \mathbb{N}} U_j \Rightarrow \exists \{\varphi_j\}_{j \in \mathbb{N}}$ partition of unity subordinate to $\{U_j\}_{j \in \mathbb{N}}$. We can write $u = \sum_{j \in \mathbb{N}} u\varphi_j$, where $u\varphi_j \in W^{k,p}(\Omega)$, supp $u\varphi_j \subset U_j \subset \Omega_{j+1} \subset \Omega$. This is ready for convolution with $\varepsilon_j > 0$: set $v_j = (u\varphi_j)_{\varepsilon_j}$ and fix an arbitrary $\delta > 0$. By the properties of regularization, we have

$$\|v_j - u\varphi_j\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(U)} < \frac{\delta}{2^{j-1}},$$

for any $U \subset \Omega$, for $\varepsilon_j > 0$ sufficiently smalls. In fact, if needed, make the ε_j smaller so that

$$\operatorname{supp} v_j \subset \Omega_{j+2}/\overline{\Omega_{j-2}}.$$

That is completely possible: from the properties of regularization, we know

$$\operatorname{supp} v_i \subset \mathrm{B}(0,\varepsilon) + \overline{U_i},$$

and since

$$\overline{U_j} = \overline{\Omega_{j+1}}/\Omega_{j-1} \subset \overline{\Omega_{j+2}}/\Omega_{j-2} \subset \overline{\overline{\Omega_{j+2}}/\Omega_{j-2}} = \Omega_{j+2}/\overline{\Omega_{j-2}},$$

the compact set $\overline{U_j}$ is contained in the open set $\Omega_{j+2}/\overline{\Omega_{j-2}}$, meaning with ε_j small, the set $\overline{U_j}$ + B(0, ε_j) will still be in $\Omega_{j+2}/\overline{\Omega_{j-2}}$. Also, let us take possibly ε_j even smaller to have a nice inequality: for fixed $N \in \mathbb{N}$:

$$\|v_j - u\varphi_j\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(U)} < \frac{1}{2 - \left(\frac{1}{2}\right)^{N+1}} \frac{\delta}{2^{j-1}},$$

meaning of $N \in \mathbb{N}$ will be evident later.

Set

$$v = \sum_{j \in \mathbb{N}} v_j,$$

then $v \in C^{\infty}(\Omega)$, (not clearly in $W^{k,p}(\Omega)$ however) as $\forall x \in \Omega$ the sum contains at most finitely many terms $(\mathcal{F} \text{ is locally finite.})$

Take the $N \in \mathbb{N}$ and estimate the norm $||u-v||_{W^{k,p}(\Omega_N)}$. Observe (the sum again contains only finitely many terms)

$$u-v=\sum_{j=1}^{\infty}(u\varphi_j-v_j),$$

so taking $x \in \Omega_N$ i have

$$(u-v)(x) = \sum_{j=1}^{N+2} (u\varphi_j - v_j),$$

because for m > N + 2, i.e., m - 2 > N it holds the functions u_m, v_m , have their supports in

- supp $u_m \subset U_m = \Omega_{m+1}/\overline{\Omega_{m-1}}$,
- $\sup v_m \subset \Omega_{m+2}/\overline{\Omega_{m-2}}$,

but $\Omega_{m-1} \subset \Omega_{m-2} \subset \Omega_N$, for N < m-2, meaning that the set Ω_N does not lie in the supports of those functions. The norm of sum is (recall $\Omega_N \subset \Omega$, so the above estimate holds)

$$\|u-v\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega_N)} \leq \sum_{j=1}^{N+2} \|u\varphi_j - v_j\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega_N)} < \delta \frac{1}{2 - \left(\frac{1}{5}\right)^{N+1}} \sum_{j=1}^{N+2} \frac{1}{2^j} = \delta.$$

It only remains to let $N \to \infty$ and realize

$$||u-v||_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega_N)} \to ||u-v||_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)}$$

by Lévi's theorem:

$$\sup_{N\in\mathbb{N}}\int_{\Omega_N}|D^\alpha f|\,\mathrm{d}x=\sup_{N\in\mathbb{N}}\int_{\mathbb{R}^d}|D^\alpha f|\chi_{\Omega_N}(x)\,\mathrm{d}x=\int_{\mathbb{R}^d}\sup_{N\in\mathbb{N}}|D^\alpha f|\chi_{\Omega_N}\,\mathrm{d}x\int_{\mathbb{R}^d}|D^\alpha f|\chi_{\Omega}(x)\,\mathrm{d}x=\int_{\Omega}|D^\alpha f|\,\mathrm{d}x\,,$$

since $\Omega_{N-1} \subset \Omega_N \forall N \in \mathbb{N}$, and $|D^{\alpha}f|$ is nonnegative, so the sequence under the integral is nondecreasing. Alltogether,

$$||u - v||_{\mathbf{W}^{k,p}(\Omega)} \le \delta, \forall \delta > 0$$

from which it follows $v \in W^{k,p}(\Omega)$ (this was not totally evident) and thus $v \in W^{k,p}(\Omega) \cap C^{\infty}(\Omega)$ so indeed we have showed the desired density.

Remark. It is nice that we only require Ω to be open (no boundary regularity required), but on the other hand, we don't have any information about the function's behaviour near it.

Remark (C^{k,\lambda} domain). Recall we call $\Omega \subset \mathbb{R}^d$ to be of class C^{k,\lambda} if: Ω is open and bounded, $\exists m \in \mathbb{N}, k \in \mathbb{N}_0, \lambda \in [0,1], \alpha, \beta \in \mathbb{R}^+, \exists$ open sets $U_j \subset \mathbb{R}^d, \exists a_j : B(0,\alpha) \subset \mathbb{R}^{d-1} : \to \mathbb{R} \text{ s.t. } a_j \in C^{k,\lambda}\left(B(0,\alpha)\right), \exists \mathbb{A}_j \mathbb{R}^d \to \mathbb{R}^d$ affine orthogonal matrices such that

- 1. $\partial \Omega \subset \bigcup_{j=1}^m U_j$,
- 2. $\forall j \leq m : \emptyset \neq \partial \Omega \cap U_j = \mathbb{A}_j (\{(x', a_j(x') \in \mathbb{R}^d | x' \in U(0, \alpha) \subset \mathbb{R}^{d-1}\}),$
- 3. $\forall j \leq m : \mathbb{A}_j(\{(x', a_j(x') + b) | x' \in U(0, \alpha), b \in (0, \beta)\}) \subset \Omega$,
- 4. $\forall j \leq m : \mathbb{A}_i(\{(x', a_i(x') b) | x' \in U(0, \alpha), b \in (0, \beta)\}) \subset \mathbb{R}^d / \overline{\Omega}$.

If $\lambda = 0$ we sometimes drop it and write $\Omega \in \mathbb{C}^{k,0} \Leftrightarrow \Omega \in \mathbb{C}^k$, if $k = 0, \lambda = 1$ we call $\Omega \in \mathbb{C}^{0,1}$ to be a Lipschitz domain. Remember that $\lambda(\Omega) < \infty$ is a part of the definition.

Theorem 5 (Global approximation by smooth functions up to the boundary). Let $\Omega \in C^{0,0}$, $k \in \mathbb{N}, p \in [1, \infty)$. Then $C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$ is dense in $W^{k,p}(\Omega)$.

Proof. Let $u \in W^{k,p}(\Omega)$, and $\varepsilon > 0$, be given. We wish to find $v \in C^{\infty}(\overline{\Omega})$ s.t. $||u - v||_{W^{k,p}(\Omega)} < \varepsilon$. The sketch is simple:

- 1. covering of $\overline{\Omega}$,
- 2. partition of unity,
- 3. approximation of u on the covering sets,
- glue it together.

Set $U_0 = \Omega$, and let $\{U_j\}_{j=1}^m$ be from the definition of $\operatorname{C}^{0,0}$ boundary. Then

$$\overline{\Omega} \subset \bigcup_{j=0}^m U_j,$$

Take $\{\varphi_j\}$ to be the partition of unity on $\overline{\Omega}$, subordinate to $\{U_j\}_{j=0}^m$. Since

$$u = \sum_{j=0}^{m} u\varphi_j$$
, on Ω

⁴Our choice $U_0 = \Omega$ is important, as without it the definition of $C^{0,0}$ boundary only means $\partial \Omega \subset \bigcup_{j=1}^m U_j$.

observe that $u_j := u\varphi_j \in W^{k,p}(\Omega)$, supp $u_j \subset \text{supp } \varphi_j \subset U_j$. Also, we define $u(x) = 0, \forall x \in \mathbb{R}^d/\Omega$. The proofs differs in the cases j = 0 and $j \in \{1, \ldots, m\}$.

Case j = 0. We have supp $u\varphi_0 \subset U_0 = \Omega$. That means that after the extension of $u\varphi_0$ by zero outside of Ω , it holds $u\varphi_0 \in W^{k,p}(\mathbb{R}^d)$. Since $W^{k,p}(\mathbb{R}^d) = W_0^{k,p}(\mathbb{R}^d) = \overline{\mathcal{D}(\mathbb{R}^d)}^{\|\cdot\|_{W^{k,p}(\mathbb{R}^d)}}$, we can find $v_0 \in \mathcal{D}(\mathbb{R}^d)$ s.t.

$$\|v_0 - u_0\|_{\mathbf{W}^{k,p}(\mathbb{R}^d)} = \|v_0 - u\varphi_0\|_{\mathbf{W}^{k,p}(\Omega)} < \frac{\varepsilon}{m+1}.$$

Notice that naturally

$$\mathcal{D}(\mathbb{R}^d) \subset \mathrm{C}^{\infty}_{\Omega}(\mathbb{R}^d),$$

and so $v_0 \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$.

Case $j \in \{1, ..., m\}$. We have a problem now: $\{U_j\}_{j=1}^m$ covers $\partial\Omega$, which is a closed set and we cannot simply use local approximation theorem. One could imagine if we were to mollify in the neighbourhood of $\partial\Omega$, the kernel would pick up values from outside of Ω , where u = 0 and the mollification would not be a good approximation. Instead, we approximate u_j on a larger open domain containing $\overline{\Omega}$ and then show this is also a good approximation of u_j on $\Omega \subset \overline{\Omega}$.

Set $u_j = u\varphi_j$, and denote

$$S_j = \mathbb{A}_j \left(\left\{ (x', x_d) | a_j(x') - \frac{\beta}{2} < x_d < a_j(x'), x' \in \mathrm{U}(0, \alpha) \right\} \right)$$

$$\Omega_j = \mathbb{R}^d / \overline{S_j},$$

i.e.,

"
$$\Omega_j = \Omega \cup \mathbb{A}_j \left(\left\{ (x', x_d) | x_d \le a_j(x') - \frac{\beta}{2} \right\} \right),$$
"

(although this is a bit inaccurate). Realize that since u = 0 outside of Ω , also u_j is zero there and in particular it is zero on that "lower strip". Clearly then $u_j \in W^{k,p}(\Omega_j)$. Now pick $\delta \in (0, \frac{\beta}{2})$, where β is from the definition of $C^{0,0}$ and set

$$S_j^{\delta} = \mathbb{A}_j \left(\left\{ (x', x_d) | a_j(x') - \frac{\beta}{2} - \delta < x_d < a_j(x') - \delta, x' \in \mathrm{U}(0, \alpha) \right\} \right),$$

$$\Omega_j^{\delta} = \mathbb{R}^d / \overline{S_j^{\delta}},$$

i.e.,

$$"\Omega_{j}^{\delta} = \Omega \cup \mathbb{A}_{j}(\{(x', x_{d}) | a_{j}(x') - \delta < x_{d} < a_{j}(x')\}) \cup \mathbb{A}_{j}\left(\left\{(x', x_{d}) | x_{d} < a_{j}(x') - \frac{\beta}{2} - \delta\right\}\right)."$$

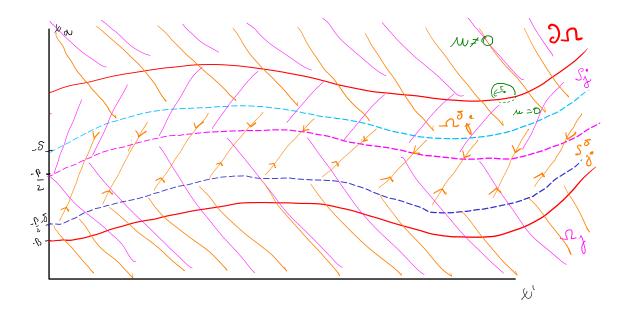

The trick is to shift the (support of) function u_j "into" Ω_j^{δ}

$$\tau_{\delta}u_{j}(\mathbb{A}_{j}(x',a_{j}(x'))) = u_{j}(\mathbb{A}_{j}(x',a_{j}(x')+\delta)), x' \in \mathrm{U}(0,\alpha) \subset \mathbb{R}^{d-1}.$$

Realize that in fact

$$\operatorname{supp}(\tau_{\delta}u_i) = \operatorname{supp}(u_i) - B(0, \delta),$$

⁵This would not hold if the support were not compactly contained in Ω .

11

Figure 1: A cumbersome sketch of $\Omega_j, S_j, \Omega_j^\delta, S_j^\delta$

from which it follows $\tau_{\delta}u_{j} \in W^{k,p}(\Omega_{j}^{\delta})$; we have only shifted the function u_{j} , but since we have also shifted S_{j} , qualitatively there is no difference. Since $\Omega \subset \Omega_{j}^{\delta}$ and $\Omega \subset \Omega_{j}^{\delta} \cap \Omega_{j}$, and also $\Omega \subset \Omega_{j}$, $\Omega \subset \Omega_{j}^{\delta} \cap \Omega_{j}$, and the fact τ_{δ} is an isometry between Sobolev spaces, we also have u_{j} , $\tau_{\delta}u_{j} \in W^{k,p}(\Omega_{j} \cap \Omega_{j}^{\delta})$. Moreover, from the properties of the shift operator it follows $\exists \delta > 0$ s.t.

$$\|u_j - \tau_\delta u_j\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} \le \|u_j - \tau_\delta u_j\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega_j \cap \Omega_j^\delta)} < \frac{\varepsilon}{2(m+1)}.$$

We are on a good track. Since we know $\tau_{\delta}u_j$ is already close to u_j , we are done once we approximate $\tau_{\delta}u_j$ by a function from $C^{\infty}\left(\overline{\Omega}\right)$. Notice that if we show $\overline{\Omega} \subset \Omega_j^{\delta}$, then clearly $C^{\infty}\left(\Omega_j^{\delta}\right) \subset C^{\infty}\left(\overline{\Omega}\right)$.

Show $\Omega \subset \Omega_j^{\delta}$: We already know $\Omega \subset \Omega_j^{\delta}$, so it suffices to show $\partial \Omega \subset \Omega_j^{\delta}$. Our parametrization of the boundary yields

$$\partial\Omega = \bigcup_{k=1}^{m} \mathbb{A}_k(\{(x',x_d)|x_d = a_k(x'), x' \in \mathrm{U}(0,\alpha)\}),$$

and the set Ω_i^{δ} is given as $\Omega_i^{\delta} = \mathbb{R}^d / \overline{S_j}$, where

$$S_j = \mathbb{A}_j \left(\left\{ (x', x_d) | a_j(x') - \frac{\beta}{2} - \delta < x_d < a_j(x') - \delta, x' \in \mathrm{U}(0, \alpha) \right\} \right).$$

Realize it suffices to show $\partial \Omega \notin \overline{S_j}$, as then it wont be excluded from \mathbb{R}^d and thus will end up in Ω_j^{δ} . Thanks to continuity of a_j , we may write

$$\overline{S_j} = \mathbb{A}_j \left(\left\{ (x', x_d) | a_j(x') - \frac{\beta}{2} - \delta \le x_d \le a_j(x') - \delta, x' \in \mathrm{U}(0, \alpha) \right\} \right).$$

i.e., the "<" have changed to " \leq ". Since we are doing everything locally, it is enough to show

$$\mathbb{A}_{j}(\{(x',x_{d})|x_{d}=a_{j}(x'),x'\in\mathrm{U}(0,\alpha)\}')\neq\mathbb{A}_{j}\left(\{(x',x_{d})|a_{j}(x')-\frac{\beta}{2}-\delta\leq x_{d}\leq a_{j}(x')-\delta,x'\in\mathrm{U}(0,\alpha)\}\right),$$

which is equivalent to

$$\left((a_j \le a_j - \delta) \land (a_j < a_j - \frac{\beta}{2} - \delta) \right) \lor \left((a_j > a_j - \delta) \land (a_j \ge a_j - \frac{\beta}{2} - \delta) \right).$$

Our choice has been $\delta \in (0, \frac{\beta}{2})$, and $\beta > 0$ from the definition of $\Omega \in \mathbb{C}^{0,0}$, so the second statement is clearly true $\forall j \in 1, \ldots, m$. Consequently $\partial \Omega \notin \overline{S}_j$ which leads to $\partial \Omega \subset \Omega_j^{\delta}$, and since also $\Omega \subset \Omega_j^{\delta}$, we have $\overline{\Omega} \subset \Omega_j^{\delta}$.

Approximation of $\tau_{\delta}u_{j}$. Since Ω_{j}^{δ} is open, by the local approximation theorem there $\exists v_{j} \in C^{\infty}(\mathbb{R}^{d})$ such that for any $U \subset \Omega_{j}^{\delta}$:

$$\|\tau_{\delta}u_j-v_j\|_{W^{k,p}(U)}\frac{\varepsilon}{2(m+1)},$$

and so in particular, (as we have shown above $\Omega \subset \overline{\Omega} \subset \Omega_j^{\delta}$,)

$$\|\tau_{\delta}u_j - v_j\|_{W^{k,p}(\Omega)} < \frac{\varepsilon}{2(m+1)}.$$

Realize that the function v_j is smooth on all \mathbb{R}^d , so in particular $v_j \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$. Approximation of u.

Finally, let us set

$$v = \sum_{j=0}^{m} v_j.$$

Then $v \in C^{\infty}_{\Omega}(\mathbb{R}^d)$ and it holds

$$\|u-v\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} = \left\| \sum_{j=0}^{m} u_{j} - \sum_{j=0}^{m} v_{j} \right\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} = \left\| \sum_{j=0}^{m} u_{j} - v_{j} \right\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} \leq \sum_{j=0}^{m} \|u_{j} - v_{j}\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} \leq \frac{\varepsilon}{m+1} + \sum_{j=1}^{m} \|v_{j} - u_{j}\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} \leq \frac{\varepsilon}{m+1} + \sum_{j=1}^{m} \|v_{j} - \tau_{\delta}u_{j}\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} + \sum_{j=1}^{m} \|\tau_{\delta}u_{j} - u_{j}\|_{\mathbf{W}^{\mathbf{k},\mathbf{p}}(\Omega)} < \frac{\varepsilon}{m+1} + 2\sum_{j=1}^{m} \frac{\varepsilon}{2(m+1)} = \varepsilon$$

This proof may still have some flaws, but the author has decided to move on.

Remark (What is $C^{\infty}_{\Omega}(\mathbb{R}^d)$). Recall

$$C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) = \left\{ u|_{\overline{\Omega}}, u \in C^{\infty}(\mathbb{R}^d) \right\}.$$

2.3 Extension of Sobolev functions

Problem of extension: For $u \in W^{k,p}(\Omega)$, does there exist

$$\overline{u} \in \mathrm{W}^{\mathrm{k},\mathrm{p}}\left(\mathbb{R}^{d}\right), \ s.t. \ \overline{u}|_{\Omega} = u, \ \|\overline{u}\|_{\mathrm{W}^{\mathrm{k},\mathrm{p}}\left(\mathbb{R}^{d}\right)} \leq C(\Omega) \|u\|_{\mathrm{W}^{\mathrm{k},\mathrm{p}}\left(\Omega\right)}$$

?

The answer is **yes**, if Ω is nice enough. Notice however this is not as simple as in the case of Lebesgue spaces, where we could just extend the function by zero trivailly. We are dealing with derivatives, that are somehow regular, and if we extend a nonzero function by zero, it might mess up the regularity of the derivatives.

We will be using C¹ diffeomorphisms heavily, so we investigate some of their properties first.

Lemma 4 (Properties of C^1 diffeomorphisms). Let $U, V \subset \mathbb{R}^d$ be open, $\Phi: U \to V$ be a C^1 diffeomorphism and let $\tilde{U} \subset \mathbb{R}^d$ s.t. $\tilde{U} \subset \subset U$. Then

- 1. $\Phi(\tilde{U}) \subset V$,
- 2. if moreover \tilde{U} is compact, then ⁶

$$\exists C > 0 : \forall u \in C^{1}(V) : \|u \circ \Phi\|_{W^{1,p}(\tilde{U})} \le C \|u\|_{W^{1,p}(\Phi(\tilde{U}))}.$$

⁶For \tilde{U} compact: $\tilde{U} \subset V \Leftrightarrow \tilde{U} \subset V$.

Proof. Ad 1.: No proof has been given.

Ad 2.: Just a change of variables formula:

$$\|u\circ\Phi\|_{\mathrm{L}_p(\tilde{U})}^p=\int_{\tilde{U}}|u\circ\Phi|^p\,\mathrm{d}x=\int_{\Phi(\tilde{U})}|u|^p|\det\nabla\Phi|^{-1}\,\mathrm{d}x\,.$$

Since Φ is one-to-one, we know $|\det \nabla \Phi| > 0$ on U, and since $\Phi \in C^1(U)$ and $\tilde{U} \subset U \Rightarrow \Phi \in C^1(\tilde{U}) \Rightarrow \det \nabla \Phi \in C^0(\tilde{U})$, and since \tilde{U} is compact, $|\det \nabla \Phi| \geq C_1 > 0 \Leftrightarrow |\det \nabla \Phi|^{-1} \leq \frac{1}{C_1}$. In total

$$\left\|u\circ\Phi\right\|_{\mathrm{L}_p\left(\tilde{U}\right)}^p\leq\frac{1}{C_1}\int_{\Phi\left(\tilde{U}\right)}\left|u\right|^p\mathrm{d}x=C\left\|u\right\|_{\mathrm{L}_p\left(\Phi\left(\tilde{U}\right)\right)}^p.$$

As for the derivative, we have $\forall i \in \{1, \dots, d\}$:

$$\int_{\tilde{U}} |\partial_{i}(u \circ \Phi)|^{p} dx \leq \int_{\tilde{U}} |\nabla(u \circ \Phi)|^{p} dx = \int_{\tilde{U}} |\nabla \Phi((\nabla u) \circ \Phi)|^{p} dx \leq
\leq \|\nabla \Phi\| \int_{\tilde{U}} |(\nabla u) \circ \Phi|^{p} dx = \|\nabla \Phi\| \int_{\Phi(\tilde{U})} |\nabla u|^{p} |\det \nabla \Phi|^{-1} dx \leq C \|\nabla \Phi\| \int_{\Phi(\tilde{U})} |\nabla u|^{p} dx \leq
\leq C \|\nabla u\|_{L_{p}(\Phi(\tilde{U}))}^{p},$$

where $\|\nabla\Phi\|$ is e.g. the operator norm of the matrix $\nabla\Phi$.

Lemma 5 (Flat extension). Let $\alpha, \beta > 0, K \subset U(0, \alpha) \times [0, \beta)$ be compact. Then there $\exists C > 0$, a linear operator

$$E: C^{1}\left(\left(B(0,\alpha)\times[0,\beta]\right)\right)\to C^{1}\left(\left(B(0,\alpha)\times[-\beta,\beta]\right)\right),$$

and the set $\tilde{K} \subset\subset U(0,\alpha) \times [-\beta,\beta)$ such that $\forall u \in C^1(B(0,\alpha) \times [0,\beta])$ it holds

- 1. Eu = u on $B(0, \alpha) \times [0, \beta]$,
- 2. $||Eu||_{W^{1,p}(U(0,\alpha)\times(-\beta,\beta))} \le ||u||_{W^{1,p}(U(0,\alpha)\times(0,\beta))}$. Actually,

$$||E||_{\mathcal{L}(W^{1,p}(U(0,\alpha)\times(0,\beta)),W^{1,p}(U(0,\alpha)\times(-\beta,\beta)))} = 2^{\frac{1}{p}}$$

3. if supp $u \subset K$ then supp $Eu \subset \tilde{K}$

Proof. (The set $U(0,\alpha) \times [0,\beta)$ is a cylinder of radius α and height β)

The proof is constructive: for the assumed u we write $(x = (x', x_d), \text{ where } x' \in B(0, \alpha) \subset \mathbb{R}^{d-1}, x_d \in [0, \beta] \subset \mathbb{R})$

$$Eu(x', x_d) = \begin{cases} u(x', x_d), & x_d \ge 0\\ -3u(x', -x_d) + 4u(x', -\frac{x_d}{2}), & x_d < 0. \end{cases}$$

Does Eu lie in $C^1(B(0,\alpha) \times [-\beta,\beta])$? Since $u \in C^1(B(0,\alpha) \times [0,\beta])$, it us continuous in the "lower cylinder", check only the transition through the origin plane: take some $a = (x',0) \in B(0,\alpha) \times \{0\}$. Then

$$\lim_{x \to a} Eu(x) = \begin{cases} u(a), & x_d \ge 0\\ -3u(a) + 4u(a) = u(a), & x_d < 0, \end{cases}$$

so Eu is continuous. The derivatives

$$\lim_{x \to a} \partial_d E u(x', x_d) = \begin{cases} \partial_d u(x', 0), & x_d \ge 0 \\ \left(-3\partial_d u(x', -x_d)(-1) + 4\partial_d u(x', -\frac{x_d}{2})(-\frac{1}{2}) \right) \Big|_{x_d = 0} = \partial_d u(x', 0), & x_d < 0, \end{cases}$$

and also for any $i \in \{1, \ldots, d-1\}$

$$\lim_{x \to a} \partial_i Eu(x_1, \dots, x_d) = \begin{cases} = \partial_i u(x_1, \dots, 0), & x_d \ge 0 \\ = -3\partial_i u(x_1, \dots, 0) + 4\partial_i u(x_1, \dots, 0) = \partial_i u(x_1, \dots, 0) \end{cases}$$

so the the derivative is also continuous. Thus, we have

$$Eu \in C^1 \subset W^{1,p}(U(0,\alpha) \times (-\beta,\beta))$$
.

The first property is clear from the definition of Eu, the estimates of the norm: (all derivatives can in fact be assumed classical)

$$\begin{split} \|Eu\|_{\mathbf{W}^{1,p}(\mathbf{U}(0,\alpha)\times(-\beta,\beta))}^{p} &= \|Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,\beta))}^{p} + \sum_{|\alpha|=1} \|D^{\alpha}Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,\beta))}^{p} = \\ &= \|Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} + \|Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,0))}^{p} \\ &+ \sum_{|\alpha|=1} \|D^{\alpha}Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} + \sum_{|\alpha|=1} \|D^{\alpha}Eu\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,0))}^{p} = \\ &= \|u\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} + \|4u - 3u\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,0))}^{p} + \\ &+ \sum_{|\alpha|=1} \|D^{\alpha}u\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} + \sum_{|\alpha|=1} \|D^{\alpha}(4u - 3u)\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(-\beta,0))}^{p} \\ &= 2\|u\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} + 2\sum_{|\alpha|=1} \|D^{\alpha}u\|_{\mathbf{L}_{p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} = 2\|u\|_{\mathbf{W}^{1,p}(\mathbf{U}(0,\alpha)\times(0,\beta))}^{p} \end{split}$$

and so

$$||Eu||_{W^{1,p}(U(0,\alpha)\times(-\beta,\beta))} = 2^{\frac{1}{p}} ||u||_{W^{1,p}(U(0,\alpha)\times(0,\beta))}$$

Where we have used the obvious fact

$$\int_{\mathrm{U}(0,\alpha)\times(0,\beta)} |f|^p \,\mathrm{d}x = \int_{\mathrm{U}(0,\alpha)\times(-\beta,0)} |f|^p \,\mathrm{d}x,$$

We will assume (although this is with a loss of generality), that

$$Eu(x', x_d) = 0 \Leftrightarrow (u(x', x_d) = 0 \lor 3u(x', -x_d) = 0 \lor 4u(x', -\frac{x_d}{2}) = 0),$$

i.e., that support lies in

$$\operatorname{supp} Eu \subset \{(x', x_d) \in \mathrm{U}(0, \alpha) \times [0, \beta] | u(x', x_d) = 0\} \cup \{(x', x_d) \in \mathrm{U}(0, \alpha) \times [-\beta, 0] | u(x', -x_d) \neq 0\} \cup \left\{(x', x_d) \in \mathrm{U}(0, \alpha) \times [-\beta, 0] | u(x', -\frac{x_d}{2}) \neq 0\right\}.$$

Denote $\Phi_1, \Phi_2 : U(0, \alpha) \times (0, \beta) \to U(0, \alpha) \times (-\beta, \beta)$ to be the mappings

$$\Phi_1(x', x_d) = (x', -x_d),$$

 $\Phi_2(x', x_d) = (x', -\frac{x_d}{2}),$

then clearly Φ_1, Φ_2 are C¹ diffeomorphisms and

$$u(x', -x_d) = (u \circ \Phi_1)(x', x_d), u(x', -\frac{x_d}{2}) = (u \circ \Phi_2)(x', x_d),$$

i.e.,

$$u(x', x_d) = (u \circ \Phi_1^{-1})(x', -x_d) = (u \circ \Phi_2^{-1})(x', -\frac{x_d}{2}),$$

and so

$$\operatorname{supp} Eu \subset \operatorname{supp} u \cup \Phi_1^{-1}(\operatorname{supp} u) \cup \Phi_2^{-1}(\operatorname{supp} u) \subset K \cup \Phi_1^{-1}(K) \cup \Phi_2^{-1}(K),$$

as supp $u \subset\subset K$. Let us define

$$\tilde{K} := K \cup \Phi_1^{-1}(K) \cup \Phi_2^{-1}(K),$$

Then we see

$$\operatorname{supp} Eu \subset K \cup \Phi_1^{-1}(K) \cup \Phi_2^{-1}(K) = \tilde{K},$$

And, finally, we have $K \subset \mathrm{U}(0,\alpha) \times [0,\beta) \Rightarrow K \subset \mathrm{U}(0,\alpha) \times (-\beta,\beta) \Rightarrow \Phi_1^{-1}(K), \Phi_2^{-1}(K) \subset \mathrm{U}(0,\alpha) \times (0,\beta)$, which really implies

$$\tilde{K} \subset \mathrm{U}(0,\alpha) \times [-\beta,\beta).$$

Let us prove the main result.

Theorem 6 (Extension of Sobolev functions). Let $\Omega \in C^{k-1,1}$, $k \in \mathbb{N}$, $p \in [1, \infty]$, $V \subset \mathbb{R}^d$ open such that $\Omega \subset V$. Then there is $E: W^{k,p}(\Omega) \to W^{k,p}(\mathbb{R}^d)$ bounded linear operator such that

- 1. $\forall u \in W^{k,p}(\Omega) : Eu = u \text{ a.e. } in \Omega,$
- 2. $\forall u \in W^{k,p}(\Omega) : \operatorname{supp} Eu \subset V \supset \Omega$,
- 3. $||E||_{\mathcal{L}(W^{k,p}(\Omega),W^{k,p}(\mathbb{R}^d))} \leq C, C = C(p,\Omega,V).$

Proof. Will only be presented for $k = 1, \Omega \in C^1, p < \infty$. The strategy is:

- 1. covering of $\overline{\Omega}$ & partition of unity
- 2. obtain a diffeomorphism from the fact $\Omega \in \mathbb{C}^{1,0}$,
- 3. suitable composition & cut off,
- 4. flat extension,
- 5. show existence of $E: C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) \to W^{k,p}(\mathbb{R}^d)$ with the desired properties,

6. extend via density

Covering of Ω : In the following, $U_j, a_j, \mathbb{A}_j, \alpha, \beta$ are as in the definition of a $\mathbb{C}^{1,0}$ domain. Set $U_0 = \Omega$ and realize

$$\overline{\Omega} \subset \bigcup_{j=0}^m U_j,$$

i.e., $\{U_j\}_{j=0}^m$ is an open covering of $\overline{\Omega}$. Denote $\{\varphi_j\}_{j=0}^m$ as the partition of unity subordinate to $\{U_j\}_{j=0}^m$.

Diffeomorphism & flat extension For $j \in \{1, ..., m\}$ we define $\Phi_i : U(0, \alpha) \times (-\beta, \beta) \to U_i$ by

$$\Phi_j(y', y_d) = \mathbb{A}_j(y', a_j(y') + y_d), y' \in \mathbb{R}^{d-1}, y_d \in \mathbb{R}.$$

(A bit confusingly, we will however be "interpreting" Φ_j as $\Phi_j : \mathrm{U}(0,\alpha) \times (-\beta,\beta) \to \mathbb{R}^d$, with it being extended by zero on $\mathbb{R}^d/\overline{U_j}$, as we need Φ_j^{-1} to be defined on the whole \mathbb{R}^d .)

As $\Omega \in \mathbb{C}^{1,0}$, we know $a_j \in \mathbb{C}^1(B(0,\alpha)) \subset \mathbb{C}^1(U(0,\alpha))$, and so ϕ_j is a \mathbb{C}^1 diffemorphism. Let us denote by $\tilde{E} : \mathbb{C}^1(B(0,\alpha) \times [-\beta,\beta]) \to \mathbb{C}^1(B(0,\alpha) \times [-2\beta,\beta])$ the extension operator from the Flat extension lemma. Then we for any $u \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) : u = \sum_{j=1}^m \varphi_j u$ define

$$Eu = \varphi_0 u + \sum_{j=1}^m \left(\eta \tilde{E}((\varphi_j u) \circ \Phi_j) \right) \circ \Phi_j^{-1},$$

where $\eta \in C^{\infty}$ (U(0, α) × \mathbb{R}) is a cut-off function

$$\eta(y', y_d) \begin{cases}
= 1 \text{ on } y_d \ge 0, \\
= 0 \text{ on } y_d \le -2h, \\
\in (0, 1) \text{ else.}
\end{cases}$$

for some parameter h > 0 which will be defined later. With this definition, $\forall x \in \Omega$ it holds

$$(Eu)(x) = (\varphi_0 u)(x) + \sum_{j=1}^m \left(\eta \tilde{E}(u\varphi_j \circ \Phi_j) \right) \underbrace{\left(\Phi_j^{-1}(x) \right)}_{\in \mathcal{U}(0,\alpha) \times (-\beta,\beta)} =$$

$$= (\varphi_0 u)(x) + \sum_{j=1}^m \left(u\varphi_j \circ \Phi_j \right) \left(\Phi_j^{-1}(x) \right) = (\varphi_0 u)(x) + \sum_{j=1}^m \left(u\varphi_j \right)(x) = \sum_{j=0}^m \left(u\varphi_j \right)(x) = u(x) \sum_{j=0}^m \varphi_j(x) = u(x),$$

since $\eta(y) = 1$, $\tilde{E}(\varphi_j u \circ \Phi_j)(y) = (\varphi_j u \circ \Phi_j)(y)$ for $y \in U(0, \alpha) \times (-\beta, \beta)$, according to our definition of η and the properties of the extension \tilde{E} .

The motivation behind the cutoff is the following: we know supp $\varphi_j \subset U_j$, so since $\Phi_j : \mathrm{U}(0,\alpha) \times (-\beta,\beta) \to U_j$, we have supp $u\varphi_j \circ \Phi_j \subset \mathrm{U}(0,\alpha) \times (-\beta,\beta)$ and from the properties of the flat extension operator we also have supp $\tilde{E}(u\varphi_j \circ \Phi_j) \subset \mathrm{U}(0,\alpha) \times (-2\beta,\beta)$. Since moreover supp $\eta = \mathrm{U}(0,\alpha) \times (-2h,\infty)$, in total

$$\operatorname{supp} \eta \tilde{E}(u\varphi_j \circ \Phi_j) = \operatorname{supp} \eta \cap \operatorname{supp} \tilde{E}(u\varphi_j \circ \Phi_j) = \mathrm{U}(0,\alpha) \times (-2h,\infty) \cap (-\beta,\beta),$$

and also ⁷

$$\operatorname{supp} Eu \subset \Phi_j \big(\operatorname{supp} \eta \tilde{E} (u\varphi_j \circ \Phi_j) \big).$$

 $^{{}^{7}\}text{Generally, supp }v\circ\Psi^{-1} = \overline{\{x\in\mathbb{R}^d|u(\Psi^{-1}(x))\neq 0\}} = \overline{\{x\in\mathbb{R}^d|\Psi^{-1}(x)\in\text{supp }u\}} = \overline{\{x\in\mathbb{R}^d|x\in\Psi(\text{supp }u)\}} = \overline{\{x\in\mathbb{R}^d|x\in\Psi(\text{supp }u)\}}$

We need to prove supp $Eu \subset V$, where V is some neighbourhood of Ω . If it holds

$$\operatorname{supp} \eta \tilde{E}(u\varphi_j \circ \Phi_j) \subset \mathrm{U}(0,\alpha) \times (-\beta,\beta),$$

the desired property holds, as then

$$\operatorname{supp} Eu \subset \operatorname{supp} u_0 \cup \bigcup_{j=1}^m \Phi_j \left(\operatorname{supp} \eta \tilde{E}(u\varphi_j \circ \Phi_j)\right) \subset U_0 \cup \bigcup_{j=1}^m \Phi_j \left(\operatorname{U}(0,\alpha) \times (-\beta,\beta)\right) \subset \bigcup_{j=0}^m U_j,$$

and from the assumptions $\overline{\Omega} \subset \bigcup_{i=0}^m U_i$, and the union is open. Meaning, the support is contained within an open set, in which Ω is compactly contained.⁸ In total, if

$$\operatorname{supp} \eta \tilde{E}(u\varphi_j \circ \Phi_j) = \operatorname{U}(0,\alpha) \times (-2h,\infty) \cap (-\beta,\beta) \subset \operatorname{U}(0,\alpha) \times (-\beta,\beta).$$

So if h is such that $-2h > -\beta \Leftrightarrow h < \frac{\beta}{2}$, we can guarantee supp $Eu \subset \bigcup_{j=0}^m U_j$ and that is what we

Finally, E is clearly linear, its norm: (we are using the lemma about flat extension and the properties of C¹ diffeomorphisms together with the facts $\eta \leq 1$ on $U(0,\alpha) \times (-\beta,\beta)$, $\Phi_i(U(0,\alpha) \times (0,\beta)) \subset$ $U_i, \Phi_i^{-1}(\mathbb{R}^d) \subset {}^9, \mathrm{U}(0,\alpha) \times (-\beta,\beta), {}^{10})$

$$||Eu||_{\mathbf{W}^{1,p}(\mathbb{R}^d)} = ||(\eta \tilde{E}(\varphi u_j \circ \Phi_j)) \circ \Phi_j^{-1}||_{\mathbf{W}^{1,p}(\mathbb{R}^d)} \leq C ||\eta \tilde{E}(\varphi u_j \circ \Phi_j)||_{\mathbf{W}^{1,p}(\mathbf{U}(0,\alpha) \times (-\beta,\beta))} =$$

$$= C ||\tilde{E}(u\varphi_j \circ \Phi_j)||_{\mathbf{W}^{1,p}(\mathbf{U}(0,\alpha) \times (-\beta,\beta))} \leq C ||u\varphi_j \circ \Phi_j||_{\mathbf{W}^{1,p}(\mathbf{U}(0,\alpha) \times (0,\beta))} \leq$$

$$\leq C ||u\varphi_j||_{\mathbf{W}^{1,p}(U_j \cap \Omega)} \leq C ||u||_{\mathbf{W}^{1,p}(\Omega)},$$

from which it clearly follows $||E||_{\mathcal{L}(\mathbf{W}^{1,p}(\Omega),\mathbf{W}^{1,p}(\mathbb{R}^d))} \leq C$.

So all the properties hold for $u \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$, let us show them also for $u \in W^{1,p}(\Omega)$. Pick an arbitrary $u \in W^{1,p}(\Omega)$, find $\{u_k\} \subset C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) : u_k \to u \text{ in } W^{1,p}(\Omega)$. Since E is continous, we know $\lim_{k\to\infty} Eu_k$ exists. Let us set

$$Eu := \lim_{k \to \infty} Eu_k,$$

where Eu_k is defined above for $u_k \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$.

Ad 3): Clearly $E(\alpha u) = \lim_{k \to \infty} E(\alpha u_k) = \alpha E u, E(u+v) = \lim_{k \to \infty} E(u_k+v_k) = \lim_{k \to \infty} E u_k + v_k$ $Ev_k = Eu + Ev$, since E on the continous functions is linear. Also

$$||Eu||_{W^{1,p}(\mathbb{R}^d)} = \left| \lim_{k \to \infty} Eu_k \right||_{W^{1,p}(\mathbb{R}^d)} = \lim_{k \to \infty} ||Eu_k||_{W^{1,p}(\mathbb{R}^d)} \le ||E|| \lim_{k \to \infty} ||u_k||_{W^{1,p}(\mathbb{R}^d)} = ||E|| ||u||_{W^{1,p}(\mathbb{R}^d)},$$

(we are using $\{Eu_k\}$ has a limit); we see our above definition truly yields a continuous linear operator.

⁸This might not exactly be the formulation of the theorem, but is pretty close. But come on, we are already proving something different then the original formulation...

⁹We can somehow extend Φ_j^{-1} by zero from $U_j \subset \Omega \subset \mathbb{R}^d$ to be defined on the whole \mathbb{R}^d (i guess)

 $^{^{10}}$...even though the assumptions to use those are not totally valid... but doc. Kaplicky is okay with that

Ad 1): $\forall a.a. x \in \Omega : Eu(x) = \lim_{k \to \infty} Eu_k(x) = \lim_{k \to \infty} u_k(x) = u(x)$, Ad 2): $\operatorname{supp} Eu_k \subset U(\Omega, \varepsilon) \Rightarrow \operatorname{supp} Eu \subset \overline{U(\Omega, \varepsilon)} \subset V$.

$$\operatorname{supp} Eu = \left\{ x \in \mathbb{R}^d \middle| \lim_{k \to \infty} Eu_k \neq 0 \right\} \subset \bigcap_{k=1}^{\infty} \underbrace{\operatorname{supp} Eu_k}_{\in V} \subset V.$$

We are done.

Remark ($\Omega \in C^{0,1}$ suffices). The theorem is still valid if we assume only $\Omega \in C^{0,1}$ and $p \in (1, \infty), k \in \mathbb{N}$, but the construction of the extension must be different. "It seems the result is not known for $\Omega \in C^{0,1}$ and p = 1, or $p = \infty$."

2.4 Embedding theorems

From the definition of $W^{k,p}(\Omega)$ it immediately follows $W^{k,p}(\Omega) \subset L_p(\Omega)$. Can we obtain $W^{k,p}(\Omega) \subset L_q(\Omega)$ for some q > p? The answer **yes**, if Ω is again nice enough (and there will also be some dependence on the dimension of \mathbb{R}^d .)

2.4.1 Theorems for $p \le d$

Example. Let $u \in \mathcal{D}(\mathbb{R}^2)$. Then

$$u(x_1, x_2) = \int_{-\infty}^{x_1} \partial_1 u(s, x_2) ds = \int_{-\infty}^{x_2} \partial_2 u(x_1, s) ds,$$

SC

$$\|u\|_{L_{2}(\mathbb{R}^{2})}^{2} = \int_{\mathbb{R}^{2}} |u(x_{1}, x_{2})|^{2} dx_{1} dx_{2} = \int_{\mathbb{R}} \int_{\mathbb{R}} |u(x_{1}, x_{2})|^{2} dx_{1} dx_{2} \leq$$

$$\leq \left(\int_{\mathbb{R}} \int_{-\infty}^{x_{1}} |\partial_{1} u(s, x_{2})| ds dx_{2}\right) \left(\int_{\mathbb{R}} \int_{-\infty}^{x_{2}} |\partial_{2} u(x_{1}, s)| ds dx_{2}\right) \leq$$

$$\leq \left(\int_{\mathbb{R}} \int_{\mathbb{R}} |\partial_{1} u(s, x_{2})| ds dx_{2}\right) \left(\int_{\mathbb{R}} \int_{\mathbb{R}} |\partial_{2} u(x_{1}, s)| ds dx_{2}\right) \leq$$

$$\leq \left(\int_{\mathbb{R}} \int_{\mathbb{R}} |\nabla u(s, x_{2})| ds dx_{2}\right) \left(\int_{\mathbb{R}} \int_{\mathbb{R}} |\nabla u(x_{1}, s)| ds dx_{2}\right) =$$

$$= \left(\int_{\mathbb{R}^{2}} |\nabla u| dx\right) \left(\int_{\mathbb{R}^{2}} |\nabla u| dx\right) = \left(\int_{\mathbb{R}^{2}} |\nabla u| dx\right)^{2} =$$

$$= \|\nabla u\|_{L_{1}(\mathbb{R}^{2})}^{2},$$

so

$$||u||_{L_2(\mathbb{R}^2)} \le ||\nabla u||_{L_1(\mathbb{R}^2)}.$$

This can be generalized in two ways:

- d > 2,
- less smoothness.

Lemma 6 (Gagliardo). Let $d \ge 2$. Let $\hat{u}_i : \mathbb{R}^{d-1} \to \mathbb{R}$ be nonnegative and measurable for $j \in \{1, \ldots, d\}$. We define

$$\hat{x}_j = (x_1, \dots, x_{j-1}, x_{j+1}, \dots, x_d), \hat{dx}_j = dx_1 \dots dx_{j-1} dx_{j+1} \dots dx_d$$

Consider the functions $u_j : \mathbb{R}^d \to \mathbb{R}, u_j(x) = \hat{u}_j(\hat{x}_j)$. Then

$$\int_{\mathbb{R}^d} \prod_{j=1}^d u_j(x) \, \mathrm{d}x \le \prod_{j=1}^d \left(\int_{\mathbb{R}^{d-1}} \left(\hat{u}_j(\hat{x}_j) \right)^{d-1} \, \mathrm{d}\hat{\mathbf{x}}_j \right)^{\frac{1}{d-1}}. \tag{1}$$

(Both integrals can be infinity.)

Proof. Induction by dimension: The case d = 2.:

$$\int_{\mathbb{R}^2} u_1(x_1, x_2) u_2(x_1, x_2) dx_1 dx_2 = \int_{\mathbb{R}^2} \hat{u}_1(x_2) \hat{u}_2(x_1) dx_1 dx_2 = \left(\int_{\mathbb{R}} \hat{u}_1(x_2) dx_2 \right) \left(\int_{\mathbb{R}} \hat{u}_2(x_1) dx_1 \right) = \left(\int_{\mathbb{R}} \hat{u}_1(\hat{x}_1) d\hat{x}_1 \right) \left(\int_{\mathbb{R}} \hat{u}_2(\hat{x}_2) d\hat{x}_2 \right).$$

(an equality in fact.) We have used Fubini once, which is permitted, as we have measurability + nonnegativity.

The case $d \rightarrow d+1$ Before we proceed, recall the "generalized Holder", all functions are nonnegative

$$\int_{\Omega} \prod_{j=1}^{d} f_j \, \mathrm{d}x \le \prod_{j=1}^{d} \left(\int_{\Omega} f_j^{p_j} \, \mathrm{d}x \right)^{\frac{1}{p_j}},$$

where $\sum_{j=1}^d \frac{1}{p_j}=1$. See that if we take $p_j=d$, then $\sum_{j=1}^d \frac{1}{d}=\frac{1}{d}\sum_{j=1}^d 1=1$, so

$$\int_{\Omega} \prod_{j=1}^{d} f_j \, \mathrm{d}x \le \prod_{j=1}^{d} \left(\int_{\Omega} f_j^d \, \mathrm{d}x \right)^{\frac{1}{d}}.$$

Let us compute:

$$\int_{\mathbb{R}^{d+1}} \prod_{j=1}^{d+1} u_{j}(x) \, \mathrm{d}x = \int_{\mathbb{R}^{d}} \int_{\mathbb{R}} \prod_{j=1}^{d} u_{j} \underbrace{u_{d+1}^{-\hat{a}\hat{x}_{d+1}}}_{\mathrm{d}x_{1} \dots \, \mathrm{d}x_{d}} \, \mathrm{d}x_{d+1} = \int_{\mathbb{R}^{d}} \underbrace{\left(\int_{\mathbb{R}} \prod_{j=1}^{d} u_{j} \, \mathrm{d}x_{d+1} \right)}_{\mathrm{Holder}} u_{d+1} \, \mathrm{d}\hat{x}_{d+1} \le \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \int_{\mathbb{R}^{d}} \underbrace{\left(\prod_{j=1}^{d} \int_{\mathbb{R}} u_{j}^{d} \, \mathrm{d}x_{d+1} \right)^{\frac{1}{d}} u_{d+1} \, \mathrm{d}\hat{x}_{d+1}}_{\mathrm{d}x_{1} + 1} \le \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \int_{\mathbb{R}^{d}} \underbrace{\left(\prod_{j=1}^{d} \int_{\mathbb{R}} u_{j}^{d} \, \mathrm{d}x_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} d\hat{x}_{d+1} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \int_{\mathbb{R}^{d}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}x_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} d\hat{x}_{d+1} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \int_{\mathbb{R}^{d}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \int_{\mathbb{R}^{d}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} d\hat{x}_{d+1} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d+1}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} = \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d}}}_{\mathrm{Holder}} \underbrace{\left(\int_{\mathbb{R}^{d}} u_{d}^{d} \, \mathrm{d}\hat{x}_{d+1} \right)^{\frac{1}{d$$

where the induction step is taken for the function

$$v_j = \left(\int_{\mathbb{R}} u_j^d \, \mathrm{d}x_{d+1}\right)^{\frac{1}{d-1}},$$

that is clearly nonnegative and measurable.

Remark. Sometimes, the lemma is stated as: $\hat{u}_i \in L_{\infty}(\mathbb{R}^{d-1})$, supp \hat{u}_i is compact $\forall i \in \{1, \dots, d\}$. Then

$$\int_{\mathbb{R}^d} \prod_{j=1}^d |u_j(x)| \, \mathrm{d}x \leq \prod_{j=1} \left(\int_{\mathbb{R}^{d-1}} |\hat{u}_j(\hat{x}_j)|^{d-1} \, \mathrm{d}\hat{\mathbf{x}}_i \right)^{\frac{1}{d-1}} = \prod_{j=1}^d \|\hat{u}_j\|_{\mathbf{L}_{d-1}(\mathbb{R}^{d-1})}.$$

The difference is that in our version, we have nonnegativity in the assumptions and do not requiry compact supports and essential boundedness, as we work with integrals that are possibly infinite.

Theorem 7 (Gagliardo-Nirenberg). Let $p \in [1, d)$. Then $\forall u \in W^{1,p}(\mathbb{R}^d)$:

$$||u||_{L_{p^*}(\mathbb{R}^d)} \le \frac{p(d-1)}{d-p} ||\nabla u||_{L_p(\mathbb{R}^d)},$$

where $p^* = \frac{dp}{d-p}$.

Proof. Estimate for $u \in \mathcal{D}(\mathbb{R}^d)$, then use density, as $\mathrm{W}^{1,p}(\mathbb{R}^d) = \mathrm{W}^{1,p}_0(\mathbb{R}^d)$.

$$\forall j \in \{1, \dots, d\}, x \in \mathbb{R}^d : u(x) = \int_{-\infty}^{x_j} \partial_j u(x_1, \dots, x_{j-1}, s, x_{j+1}, \dots, x_d) \, \mathrm{d}s$$

This estimate is independent of $j \in \{1, ..., d\}$, so it holds

$$|u(x)| \leq \int_{\mathbb{R}} |\nabla u|(\ldots, s, \ldots) \, \mathrm{d}s.$$

Next, consider $p=1, p^*=\frac{d}{d-1}$ and estimate:

$$|u|^{\frac{d}{d-1}} \le \left(\int_{\mathbb{R}^d} |\nabla u|(\ldots,s,\ldots) \,\mathrm{d}s\right)^{\frac{d}{d-1}} = \prod_{j=1}^d \left(\int_{\mathbb{R}} |\nabla u|(\ldots,s,\ldots) \,\mathrm{d}s\right)^{\frac{1}{d-1}}.$$

Denote

$$u_j(x_1,\ldots,x_{j-1},x_{j+1},\ldots,x_d) = \left(\int_{\mathbb{R}^d} |\nabla u| \underbrace{(\ldots,x_j,\ldots)}_{=x \text{ in fact}} dx_j\right)^{\frac{1}{d-1}},$$

which is a function independent of $x_j, u_j \equiv u_j(\hat{x}_j)$. So the integral (the $L_{\frac{d}{d-1}}(\mathbb{R}^d)$ norm)

$$\int_{\mathbb{R}^{d}} |u|^{\frac{d}{d-1}} \, \mathrm{d}x \le \int_{\mathbb{R}^{d}} \prod_{j=1}^{d} u_{j} \, \mathrm{d}x \underset{\mathrm{Gagliardo lemma}}{\le} \left(\prod_{j=1}^{d} \int_{\mathbb{R}^{d-1}} u_{j}^{d-1} (\hat{x}_{j}) \, \mathrm{d}\hat{x}_{j} \right)^{\frac{1}{d-1}} = \left(\prod_{j=1}^{d} \int_{\mathbb{R}^{d-1}} \int_{\mathbb{R}} |\nabla u|(x) \, \mathrm{d}x_{j} \, \mathrm{d}\hat{x}_{j} \right)^{\frac{1}{d-1}} = \left(\int_{\mathbb{R}^{d}} |\nabla u| \, \mathrm{d}x \right)^{\frac{d}{d-1}},$$

and so

$$\|u\|_{\mathrm{L}_{\frac{d}{d-1}}(\mathbb{R}^d)}^{\frac{d}{d-1}} \leq \|\nabla u\|_{\mathrm{L}_{1}(\mathbb{R}^d)}^{\frac{d}{d-1}},$$

meaning $(1^* = \frac{d}{d-1})$

$$||u||_{\mathcal{L}_{1}*(\mathbb{R}^d)} \le 1||\nabla u||_{\mathcal{L}_{1}(\mathbb{R}^d)}.$$

If now $p \in (1, d)$, we investigate for what q can we obtain estimate of $||u|^q||_{\mathcal{L}_{\frac{d}{q}}(\mathbb{R}^d)}$:

$$\|u\|_{L_{\frac{qd}{d-1}}(\mathbb{R}^d)}^{q} = \||u|^{q}\|_{L_{\frac{d}{d-1}}(\mathbb{R}^d)} \le \|\nabla(|u|^{q})\|_{L_{1}(\mathbb{R}^d)} = \int_{\mathbb{R}^d} q|u|^{q-1} |\nabla u| \, \mathrm{d}x \underbrace{\le}_{\text{Holder}} q\|\nabla u\|_{L_{p}(\mathbb{R}^d)} \||u|^{q-1}\|_{L_{p'}(\mathbb{R}^d)} = q\|\nabla u\|_{L_{p}(\mathbb{R}^d)} \|u\|_{L_{p(q-1)p'}(\mathbb{R}^d)}^{q-1}.$$

We want $(q-1)p' = \frac{qd}{d-1}$, so we can divide both sides:

$$q\left(\frac{p}{p-1}-\frac{d}{d-1}\right)=\frac{p}{p-1}, \Leftrightarrow q\frac{pd-p-pd+d}{(p-1)(d-1)}=\frac{d-p}{(p-1)(d-1)}=\frac{p}{p-1} \Leftrightarrow q=\frac{d-1}{d-p}p.$$

Also

$$\frac{q}{d-1} = \frac{p}{d-p} \Leftrightarrow \frac{qd}{d-1} = \frac{dp}{d-p} = p^*, q = \frac{p(d-1)}{d-p}$$

and thus

$$\|u\|_{\mathcal{L}_{p^{*}}(\mathbb{R}^{d})}^{q} \leq q \|\nabla u\|_{\mathcal{L}_{p}(\mathbb{R}^{d})} \|u\|_{\mathcal{L}_{p^{*}}(\mathbb{R}^{d})}^{q-1} \Leftrightarrow \|u\|_{\mathcal{L}_{p^{*}}(\mathbb{R}^{d})} \leq \frac{p(d-1)}{d-p} \|\nabla u\|_{\mathcal{L}_{p}(\mathbb{R}^{d})}.$$

 \Rightarrow statement holds for $u \in \mathcal{D}(\mathbb{R}^d)$. To finish, use density of $\mathcal{D}(\mathbb{R}^d)$ in $W^{1,p}(\mathbb{R}^d)$: let $u \in W^{1,p}(\mathbb{R}^d)$, be arbitrary. Then $\exists \{u_k\} \subset \mathcal{D}(\mathbb{R}^d) : u_k \to u \text{ in } W^{1,p}(\mathbb{R}^d)$. Moreover, we have showed that $\forall k \in \mathbb{N}$:

$$||u_k||_{\mathbf{L}_{p^*}(\mathbb{R}^d)} \le \frac{p(d-1)}{d-p} ||\nabla u||_{\mathbf{L}_p(\mathbb{R}^d)},$$

so passing to the (strong) limit and using the continuity of the norm indeed yields

$$||u||_{\mathbf{L}_{p^*}(\mathbb{R}^d)} \le \frac{p(d-1)}{d-p} ||\nabla u||_{\mathbf{L}_p(\mathbb{R}^d)}.$$

We are done.

Remark. • It is evident that nonzero constants are not in $W^{1,p}(\mathbb{R}^d)$ and that also the inequality does not hold for them

- the set \mathbb{R}^d is of course unbounded, so we have no ordering of $L_p(\Omega)$ spaces.
- of course, we require no smoothness of the domain

Theorem 8. Let $\Omega \subset \mathbb{R}^d$ be open. Then $\forall u \in W_0^{1,p}(\Omega), \forall p \in [1,d)$ the statement of the previous theorem holds.

Proof. An immediate corollary of the previous theorem: we have showed the inequality for $u \in \mathcal{D}(\mathbb{R}^d)$, but WLOG it holds also for $u \in \mathcal{D}(\Omega)$ (i can keep the integrals over \mathbb{R}^d , but in the end only values from Ω count) and since $W_0^{1,p}(\Omega) = \overline{\mathcal{D}(\Omega)}^{\|\cdot\|_{W^{1,p}(\Omega)}}$, i can again extend it on the whole $W_0^{1,p}(\Omega)$.

Remark. In the proof of theorem we showed that $\forall u \in W^{1,p}(\mathbb{R}^d)$ it holds

$$\|u\|_{L_{\frac{qd}{d-1}}(\Omega)}^{q} \le q\|\nabla u\|_{L_{p}(\Omega)}\|u\|_{L_{\frac{p(q-1)}{n-1}}(\Omega)}^{q-1},$$

for q such that $\frac{qd}{d-1} \le p^*$.

Definition 5 (Continuous & compact embeddings). Let X, Y be linear normed spaces. We say

• X is continuously embedded into Y, $X \hookrightarrow Y$, provided $X \subset Y$ (is a subspace) and

$$\forall x \in X: \|x\|_Y \le C \|x\|_X.$$

• X is compactly embedded into Y, $X \hookrightarrow Y$, provided $X \subset Y$ (is a subspace) and

$$\forall A \subset X \text{ bounded } : \overline{A}^Y \text{ is compact in } Y.$$

This is the same as saying $X \subset Y$ (is a subspace) and the identity $X \to Y$ is

- a bounded linear operator, id $\in \mathcal{L}(X,Y)$
- is a compact linear operator, id $\in \mathcal{K}(X,Y)$

Theorem 9 (Embedding theorem for $p \leq d$). Let $\Omega \in C^{0,1}, p^* = \frac{dp}{d-p}$. Then

• if
$$p \in [1, d)$$
, then

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega) \ \forall q \in [1, p^*],$$

• if
$$p \in [1, d)$$
, then

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, p^*),$$

•
$$if p = d$$
, then

$$W^{1,d}(\Omega) \hookrightarrow L_q(\Omega) \ \forall q \in [1, \infty),$$

• if p = d, then

$$W^{1,d}(\Omega) \hookrightarrow L_q(\Omega) \,\forall q \in [1, \infty),$$

(the same as above, i.e., every continuous embedding is also compact.)

Proof. We would like to use the previous lemmas + extension.

Ad continuity for p < d:

Recall that the composition of continuous operators yields a continuous operator. In our case:

¹¹Really, we have $||x||_Y = ||\operatorname{id} x||_Y \le ||\operatorname{id}||_{\mathcal{L}(X,Y)} ||x||_X$, and if $A \subset X$ is bounded, than from the definition of $\operatorname{id} \in \mathcal{K}(X,Y)$: $\operatorname{id}(A) = A \subset Y$ is relatively compact in Y.

- the extension operator $E: W^{1,p}(\Omega) \to W^{1,p}(\mathbb{R}^d)$ is continuous
- identity $I_1: \mathbf{W}^{1,p}(\mathbb{R}^d) \to \mathbf{L}_{p^*}(\mathbb{R}^d)$ is continous (Gagliardo-Nirenberg: $\|u\|_{\mathbf{L}_{p^*}(\mathbb{R}^d)} \le \frac{p(d-1)}{d-p} \|\nabla u\|_{\mathbf{L}_p(\mathbb{R}^d)} \le C\|u\|_{\mathbf{W}^{1,p}(\mathbb{R}^d)}$.)
- restriction $I_2: L_{p^*}(\mathbb{R}^d) \to L_{p^*}(\Omega)$ is continuous (monotonicity of the L. integral: $\Omega \subset \mathbb{R}^d \Rightarrow \|u\|_{L_{p^*}(\Omega)} \le \|u\|_{L_{p^*}(\mathbb{R}^d)}$.)
- identity $I_3: L_{p^*}(\Omega) \to L_q(\Omega)$ is continous (embedding of Lebesgue spaces: Ω is bounded $\Rightarrow L_{p^*}(\Omega) \hookrightarrow L_q(\Omega) \, \forall \, q \in [1, p^*]$)

Together, the mapping

$$id: W^{1,p}(\Omega) \to L_q(\Omega)$$
, $id = I_3 \circ I_2 \circ I_1 \circ E$

is continuous, and so $W^{1,p}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, p^*].$

Ad continuity for p = d:

If p = d, we have (this holds generally) $W^{1,d}(\Omega) \hookrightarrow W^{1,r}(\Omega) \ \forall r \in [1,d)$, (embedding of Lebesgue spaces, $L_d(\Omega) \hookrightarrow L_r(\Omega), \forall r \in [1,d)$). Notice $r^* = \frac{rd}{r-d} \to \infty$ as $r \to d-$, which means we can for all $q \in [1,\infty)$ find $r \in [1,d)$ s.t. $r^* > q$. Consequently,

$$\forall q \in [1, \infty) \exists r \in [1, d) \ s.t. \ L_{r^*}(\Omega) \hookrightarrow L_q(\Omega) \ .$$

Notice also that $\forall r \in [1, d)$ we always have

$$W^{1,r}(\Omega) \hookrightarrow L_{r^*}(\Omega)$$

(that's just renaming p with r in embedding for p < d). Then it holds

$$W^{1,d}(\Omega) \hookrightarrow W^{1,r}(\Omega) \hookrightarrow L_{r^*}(\Omega) \hookrightarrow L_q(\Omega)$$
,

and so $W^{1,d}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, \infty).$

Ad compactness for p < d:

It suffices to show $U = U_{W^{1,p}(\Omega)}(0,1)$ is relatively compact in $L_q(\Omega)$, which is, since $L_q(\Omega)$ is complete, equivalent to U being totally bounded in $L_q(\Omega)$.¹² Extend the functions to $W^{1,p}(\mathbb{R}^d)$ using the extension operator E, so $EU \subset W^{1,p}(\mathbb{R}^d)$. Take some yet undetermined $\delta > 0$ and denote by $(EU)_{\delta}$ the set of regularized functions from EU with some kernel η . Our next strategy is the following:

- 1. show $(EU)_{\delta}$ is totally bounded in $L_1(U(0,R))$,
- 2. show $W^{1,p}(\Omega) \hookrightarrow L_1(\Omega)$,
- 3. show $W^{1,p}(\Omega) \hookrightarrow L_q(\Omega)$.

 $^{^{12}\}mathrm{A}$ metric space P is totally bounded if there exists a finite $\varepsilon\text{-net}$: a finite open covering of P by balls centered in P of radii smaller than $\varepsilon.$

Since the supports of the functions from EU are uniformly bounded¹³, we know $^{14} \exists R > 0$ s.t.

$$\forall v \in (EU)_{\delta} : \operatorname{supp} v \subseteq B(0, R) \subset \mathbb{R}^d.$$

(Also remember that $\Omega \subset B(0,R)$.) Moreover, from the properties of mollification 15 it follows:

$$(EU)_{\delta} \subset C^1((B(0,R))).$$

Next up, calculate for $v \in (EU)_{\delta}$ the norm $||v||_{C^1(B(0,1))}$. Realize that in fact $v = (Eu)_{\delta}$ for some $u \in U$, and so

$$|\int_{\mathbb{R}^{d}} Eu(y)\eta_{\delta}(x-y) \, \mathrm{d}y| \leq ||Eu||_{\mathrm{L}_{p}(\mathbb{R}^{d})} ||\eta_{\delta}||_{\mathrm{L}_{p'}(\mathbb{R}^{d})} \leq C ||Eu||_{\mathrm{W}^{1,p}(\mathbb{R}^{d})} \leq C ||E||_{\mathcal{L}(\mathrm{W}^{1,p}(\Omega),\mathrm{W}^{1,p}(\mathbb{R}^{d}))} ||u||_{\mathrm{W}^{1,p}(\Omega)} \leq C,$$

as $U = U_{W^{1,p}(\Omega)}(0,1)$. Also

$$|\nabla \int_{\mathbb{R}^{d}} Eu(y)\eta_{\delta}(x-y) \, dy| = |\int_{\mathbb{R}^{d}} Eu(y)\nabla_{x}\eta_{\delta}(x-y) \, dy| \le ||Eu||_{L_{p}(\mathbb{R}^{d})} ||\nabla \eta_{\delta}||_{L_{p'}(\mathbb{R}^{d})} \le \le C||Eu||_{W^{1,p}(\mathbb{R}^{d})} \le C||E||_{\mathcal{L}(W^{1,p}(\Omega),W^{1,p}(\mathbb{R}^{d}))} ||u||_{W^{1,p}(\Omega)} \le C,$$

using the same arguments. In total

$$\forall v \in (EU)_{\delta} : ||v||_{\mathbf{C}^1(\mathbf{B}(0,R))} \le C,$$

or in other words, all functions from $(EU)_{\delta}$ are uniformly bounded in $C^1(B(0,R)) \Rightarrow$ they are uniformly bounded and uniformly equicontinuous (that is implied by uniform boundedness of the derivatives). Thus we can use Arzela-Ascoli theorem and state

$$(EU)_{\delta} \subset C^0(B(0,R))$$
.

Since $C^0(B(0,R))$ is complete, this also means $(EU)_{\delta}$ is totally bounded in $C^0(B(0,R))$. Using the fact (B(0, R) is compact) ¹⁶

$$C^0(B(0,R)) \hookrightarrow L_1(U(0,R))$$
,

we also see that $(EU)_{\delta}$ is totally bounded in $L_1(U(0,R))$.

$$\lim_{k\to\infty}\int_{\mathrm{U}(0,R)}\left|f_k\right|\mathrm{d}x=\int_{\mathrm{U}(0,R)}\lim_{k\to\infty}\left|f_k\right|\mathrm{d}x=\int_{\mathrm{U}(0,R)}\left|f\right|\mathrm{d}x=\int_{\mathrm{B}(0,R)}\left|f\right|\mathrm{d}x\leq\infty,$$

the majorant being e.g. $\max_{k \in \mathbb{N}} \|f_k\|_{\infty}$. Hence every bounded sequence in $C^0(B(0,R))$ has a converging (sub)sequence in $L_1(U(0,R))$.

¹³From the properties of extension, we know $\forall u \in W^{1,p}(\Omega) : \operatorname{supp} Eu \subset V$ with V open s.t. $\Omega \subset V$.

¹⁴Properties of mollification include supp $(Eu)_{\delta} \subset B(0,\delta) + \text{supp} Eu$.

¹⁵We have $(EU)_{\delta} \subset \mathbb{C}^{\infty}(\mathbb{R}^d)$. ¹⁶Take some sequence $\{f_k\} \subset \mathbb{C}^0(\mathbb{B}(0,R))$ that is bounded, then

Next, take an arbitrary $u \in U$ and compute (we are using the fact $Eu = u \ a.e.$ in $\Omega, \Omega \subset U(0, R)$.)

$$\|u - (Eu)_{\delta}\|_{L_{1}(\Omega)} \leq \|\overline{Eu} - (Eu)_{\delta}\|_{L_{1}(U(0,R))} = \int_{U(0,R)} |v - v_{\delta}| \, dx = \int_{U(0,R)} |v(x) - \int_{\mathbb{R}^{d}} v(y) \eta_{\delta}(x - y) \, dy \, | \, dx = \int_{U(0,R)} |v(x) - \int_{\mathbb{R}^{d}} v(x + y) - v(x) \, \underline{\eta_{\delta}(y)} \, dy \, | \, dx \leq \int_{U(0,R)} |\int_{\mathbb{R}^{d}} v(x + y) - v(x) \, \underline{\eta_{\delta}(y)} \, dy \, | \, dx \leq \int_{U(0,R)} |\int_{\mathbb{R}^{d}} v(x + y) - v(x) \, \underline{\eta_{\delta}(y)} \, dy \, | \, dx \leq \int_{U(0,R)} \int_{\mathbb{R}^{d}} \frac{|v(x + y) - v(x)|}{|y|} |\eta_{\delta}(y)| \, dy \, dx \leq \int_{U(0,R)} \int_{\mathbb{R}^{d}} \frac{|v(x + y) - v(x)|}{|y|} |\eta_{\delta}(y)| \, dy \, dx \leq \int_{U(0,R)} \int_{\mathbb{R}^{d}} \int_{U(0,R)} \frac{|v(x + y) - v(x)|}{|y|} \, dx \, |y| \, \eta_{\delta}(y) \, dy \, dx.$$

Estimate the inner integral: assume v is smooth, $v \in \mathcal{D}(U(0,R))$ and write

$$\int_{\mathrm{U}(0,R)} \frac{|v(x+y) - v(x)|}{|y|} \, \mathrm{d}x = \int_{\mathrm{U}(0,R)} \frac{1}{|y|} |\int_{0}^{1} \underbrace{\frac{\mathrm{d}}{\mathrm{d}s} (v(x+sy))}_{\nabla v(x+sy) \cdot y} \, \mathrm{d}s \, |\, \mathrm{d}x \le \int_{\mathrm{U}(0,R)} \frac{1}{|y|} \int_{0}^{1} |\nabla v(x+sy)| |y| \, \mathrm{d}s \, \mathrm{d}x = \int_{\mathrm{U}(0,R)} \int_{0}^{1} |\nabla v(x+sy)| \, \mathrm{d}s \, \mathrm{d}x = \int_{0}^{1} \int_{\mathrm{U}(0,R)} |v(x+sy)| \, \mathrm{d}x \, \mathrm{d}s.$$

The last integral can be further manipulated by using the change of variables $z := x + sy \in \{x + sy | x \in U(0,R)\} = U(0,R) + sy = U(sy,R)$. Since $\nabla v \in \mathcal{D}(U(0,R))$, the integral is nonzero only for $z \in U(sy,R) \cap U(0,R) \subset U(0,R)$ so we can write

$$\int_{0}^{1} \int_{\mathrm{U}(0,R)} |\nabla v(x+sy)| \, \mathrm{d}x \, \mathrm{d}s = \int_{0}^{1} \int_{\mathrm{U}(sy,R) \cap \mathrm{U}(0,R)} |\nabla v(z)| \, \mathrm{d}z \, \mathrm{d}s \le \int_{0}^{1} \int_{\mathrm{U}(0,R)} |\nabla v(z)| \, \mathrm{d}z \, \mathrm{d}s \le \int_{0}^{1} \|\nabla v\|_{\mathrm{L}_{p}(\mathrm{U}(0,R))} (\lambda(\mathrm{U}(0,R)))^{\frac{1}{p'}} \, \mathrm{d}s \le C(R) \|\nabla v\|_{\mathrm{L}_{p}(\mathrm{U}(0,R))},$$

and so we have shown

$$\forall v \in \mathcal{D}(U(0,1)): \int_{U(0,R)} \frac{|v(x+y) - v(x)|}{|y|} dx \le C(R) \|\nabla v\|_{L_{p}(U(0,R))}.$$

Now, take $v \in W_0^{1,p}(U(0,R))$, then $\exists \{v_k\} \subset \mathcal{D}(U(0,R)) : v_k \to v \text{ in } W_0^{1,p}(U(0,R))$. So

$$\forall y \in \mathbb{R}^d : \int_{\mathbb{R}^d} \frac{|v_k(x+y) - v_k(x)|}{|y|} \, \mathrm{d}x \le C(R) \|\nabla v_k\|_{\mathrm{L}_p(\mathrm{U}(0,R))} \to C(R) \|\nabla v\|_{\mathrm{L}_p(\mathrm{U}(0,R))}.$$

Putting it all together:

$$\|u - (Eu)_{\delta}\|_{L_{1}(\Omega)} \leq \int_{\mathbb{R}^{d}} \int_{\mathrm{U}(0,R)} \frac{|v(x+y) - v(x)|}{|y|} \, \mathrm{d}x \, |y| \eta_{\delta}(y) \, \mathrm{d}y \leq C(R) \|\nabla v\|_{L_{p}(\mathrm{U}(0,R))} \int_{\mathbb{R}^{d}} \underbrace{|y|}_{\leq \delta} \eta_{\delta}(y) \, \mathrm{d}y \leq C(R) \|\nabla v\|_{L_{p}(\mathrm{U}(0,R))} \int_{\mathbb{R}^{d}} \eta_{\delta}(y) \, \mathrm{d}y = C(R) \|\nabla v\|_{\mathrm{W}^{1,p}(\mathrm{U}(0,R))} = C(R) \|Eu\|_{\mathrm{W}^{1,p}(\mathrm{U}(0,R))} \leq C_{1} \|u\|_{\mathrm{W}^{1,p}(\Omega)} \leq C_{1} \delta.$$

¹⁷Recall we have $v \in (EU)_{\delta}$ and so supp $v \notin B(0,R)$, meaning it is "zero on S(0,R)" - in the sense of traces.

where we have used the properties of the reg. kernel η_{δ} , the extension operator E and the fact $u \in U$.

Now fix $\varepsilon > 0$, find $\{(Eu_k)_{\delta}\}_{k=1}^m$ a finite $\frac{\varepsilon}{2}$ -net in $(EB)_{\delta}$ in $L_1(U(0,R))$ (which is possible, since we have total boundedness in $L_1(U(0,R))$.) We will show $\{u_k\}_{k=1}^m$ is a (finite) ε -net in $L_1(\Omega)$.

Up to now, $\delta > 0$ has been undetermined; now comes the time - set

$$\delta > 0 \text{ s.t. } C_1 \delta < \frac{\varepsilon}{4}.$$

Fix an arbitrary $u \in U$, and find $j \in \{1, \dots, m\}$ s.t. $\|(Eu)_{\delta} - (Eu_j)_{\delta}\|_{L_1(U(0,R))} < \frac{\varepsilon}{2}$. Compute

$$\|u-u_j\|_{\mathrm{L}_1(\Omega)} \leq \|u-(Eu)_\delta\|_{\mathrm{L}_1(\Omega)} + \|(Eu)_\delta - (Eu_j)_\delta\|_{\mathrm{L}_1(\Omega)} + \|(Eu_j)_\delta - u_j\|_{\mathrm{L}_1(\Omega)} \leq C_1\delta + \frac{\varepsilon}{2}C_1\delta < \frac{\varepsilon}{4} + \frac{\varepsilon}{4} + \frac{\varepsilon}{2} < \varepsilon,$$

where we have used the above estimate and the fact $\Omega \subset B(0,R)$. Thus, we have shown U is totally bounded in $L_1(\Omega)$ and so

$$W^{1,p}(\Omega) \subset L_1(\Omega)$$
.

It remains to show the validity for a general $q \in [1, p^*)$. Using the interpolation theorem on Lebesgue spaces ¹⁸ we obtain

$$||u||_{\mathbf{L}_{q}(\Omega)} \le ||u||_{\mathbf{L}_{1}(\Omega)}^{\theta} ||u||_{\mathbf{L}_{p^{*}}(\Omega)}^{1-\theta},$$

where $\frac{1}{q} = \frac{\theta}{1} + \frac{1-\theta}{p^*}$. Let us now show U is totally bounded in $L_q(\Omega)$, *i.e.*, $\forall \epsilon > 0$ there exists a finite ϵ - net in U in $L_q(\Omega)$. Pick $\{u_j\}_{j=1}^m \subset U$ that is an $\beta > 0$ net in $L_1(\Omega)$, where β will be determined later. Then it holds

$$\|u - u_j\|_{\mathbf{L}_q(\Omega)} \le \|u - u_j\|_{\mathbf{L}_1(\Omega)}^{\theta} \|u - u_j\|_{\mathbf{L}_{p^*}(\Omega)}^{1-\theta} \le \beta^{\theta} \|u - u_j\|_{\mathbf{L}_p^*(\Omega)}^{1-\theta}$$

Since we have already shown $W^{1,p}(\Omega) \to L_{p^*}(\Omega)$, we know (again u, u_j are in U)

$$||u - u_j||_{\mathbf{L}_{p^*}(\Omega)}^{1-\theta} \le C_2 ||u - u_j||_{\mathbf{W}^{1,p}(\Omega)}^{1-\theta} \le C_2 2^{1-\theta},$$

and so

$$\|u - u_j\|_{\mathbf{L}_q(\Omega)} \le \beta^{\theta} C_2 2^{1-\theta}.$$

We see that if we choose β s.t.

$$\beta < \left(\frac{\epsilon}{C_2 2^{1-\theta}}\right)^{\frac{1}{\theta}},$$

we obtain

$$\|u-u_j\|_{\mathbf{L}_q(\Omega)} \le \epsilon,$$

i.e., $\{u_j\}_{j=1}^m$ is a ϵ -set in $L_q(\Omega)$. Thus $W^{1,p}(\Omega) \hookrightarrow L_q(\Omega)$, $\forall q \in [1, p^*)$.

 $Ad\ compactness\ for\ p=d$

Finally, let us show the last result. It holds

$$W^{1,d}(\Omega) \hookrightarrow W^{1,r}(\Omega), \forall r \in [1,d).$$

 $^{^{18}\}text{In the case }q\in [r,s)\text{ it holds }\|u\|_{\mathrm{L}_q(\Omega)}\leq \|u\|_{\mathrm{L}_r(\Omega)}^{\theta}\|u\|_{\mathrm{L}_s(\Omega)}^{1-\theta}, \frac{1}{q}=\frac{\theta}{r}+\frac{1-\theta}{s}.$

Moreover, we have just shown

$$W^{1,r}(\Omega) \hookrightarrow L_s(\Omega), \forall s \in [1, r^*).$$

Notice that $r^* = \frac{rd}{r-d} \to \infty$ as $r \to d^-$, so $\forall q \in [1, \infty)$ fixed $\exists r \in [1, d) : r^* > q$, *i.e.*, $q \in [1, r^*)$. But then

$$W^{1,d}(\Omega) \hookrightarrow W^{1,r}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, \infty).$$

And realize that implies $W^{1,d}(\Omega) \hookrightarrow L_q(\Omega) \,\forall q \in [1,\infty)$: if $\{u_n\}$ is bounded in $W^{1,d}(\Omega)$, then it is bounded in $W^{1,r}(\Omega)$, as the identity between those spaces is continuous, and the above compact embedding tells us $\{u_{n_k}\}$ is convergent in $L_q(\Omega)$ for some $\{n_k\}$. In total, $\{u_n\} \subset W^{1,d}(\Omega)$ has a subsequence $\{u_{n_k}\}$ convergent in $L_q(\Omega)$. We are done.

2.4.2 Theorems for p > d

We know we will encounter Holder spaces. Let us recall some of their properties in a remark.

Remark (Properties of Holder spaces). Let $\Omega \subset \mathbb{R}^d$ be open and bounded, $k \in \mathbb{N}_0, \lambda \in [0,1]$. The norm on the space $C^{0,1}(\overline{\Omega})$ is defined as

$$\|u\|_{\mathrm{C}^{k,\lambda}\left(\overline{\Omega}\right)} = \|u\|_{\mathrm{C}^{k}\left(\overline{\Omega}\right)} + \sum_{|\alpha|=k} \sup_{x \neq y, x, y, \in \overline{\Omega}} \frac{|D^{\alpha}u(x) - D^{\alpha}(y)|}{|x - y|^{\lambda}},$$

and the space

$$\mathbf{C}^{k,\lambda}\left(\overline{\Omega}\right) \coloneqq \left\{ u \in \mathbf{C}^{k}\left(\overline{\Omega}\right) | \|u\|_{\mathbf{C}^{k,\lambda}\left(\overline{\Omega}\right)} \le \infty \right\},\,$$

where we identify

$$C^{k,0}\left(\overline{\Omega}\right) = C^{k}\left(\overline{\Omega}\right).$$

Moreover, we have the following embeddings: $\forall \alpha \in [0,1]$ it holds

$$C^{0,\alpha}(\overline{\Omega}) \hookrightarrow C^{0,\beta}(\Omega), \forall \beta \in [1,\alpha],$$

and

$$C^{0,\alpha}(\overline{\Omega}) \hookrightarrow C^{0,\beta}(\overline{\Omega}), \forall \beta \in [1,\alpha).$$

A fresh start of a new chapter calls for a fresh new lemma.

Lemma 7 (Morrey). Let $u \in \mathcal{D}(\mathbb{R}^d)$. Then $\forall x_1, x_2 \in \mathbb{R}^d, \forall \mu \in (0,1]$ it holds

$$|u(x_1) - u(x_2)| \le \frac{2\sqrt{d}}{\mu} |x_1 - x_2|^{\mu} [\nabla u]_{L_{1,\mu}(\mathbb{R}^d)},$$

with

$$[\nabla u]_{L_{1,\mu}(\mathbb{R}^d)} = \sup_{x \in \mathbb{R}^d} \sup_{\rho > 0} \int_{[0,\rho]^d} \frac{|\nabla u(x+y)|}{\rho^{d-1+\mu}} \, \mathrm{d}y \,.$$

Proof. Pick arbitrary but fixed $x_1, x_2 \in \mathbb{R}^d$. Denote by C_ρ the closed cube with a side of length ρ s.t. x_1 and x_2 lie on opposite faces. Then $\rho \leq |x_1 - x_2| \leq \rho \sqrt{d}$ (it is not closer then the height and not further then the diagonal.)

Let us begin by first computing the deviation of $u(x_i)$ from the mean value of u on C_{ϱ} :

$$\left| \frac{1}{\lambda(C_{\rho})} \int_{C_{\rho}} u(x) dx - u(x_{i}) \right| = \left| \int_{C_{\rho}} \frac{u(x) - u(x_{i})}{\rho^{d}} dx \right| \leq \int_{C_{\rho}} \frac{|u(x) - u(x_{i})|}{\rho^{d}} dx.$$

What other can we use when estimating differences than Newton - Leibniz, right? Since $u \in \mathcal{D}(\mathbb{R}^d) \subset C^1(\mathbb{R}^d)$ it holds for $i \in \{1,2\}$ and $\forall x \in C_\rho$:

$$|u(x) - u(x_i)| \le |\int_0^1 \frac{\mathrm{d}}{\mathrm{d}s} u(x_i + s(x - x_i)) \, \mathrm{d}s| = |\int_0^1 \nabla u(x_i + s(x - x_i)) \cdot (x - x_i) \, \mathrm{d}s| \le \int_0^1 |\nabla u(x_i + s(x - x_i))| |x - x_i| \, \mathrm{d}s \le \rho \sqrt{d} \int_0^1 |\nabla u(x_i + s(x - x_i))| \, \mathrm{d}s.$$

Notice that it is important $x \in C_{\rho}$ and x_1, x_2 are on the opposite sides. With this estimate for $|u(x) - u(x_i)|$ and Fubini we can write for the deviation

$$\left| \frac{1}{\rho^d} \int_{C_\rho} u(x) \, \mathrm{d}x - u(x_i) \right| \leq \sqrt{d} \int_{C_\rho} \frac{1}{\rho^{d-1}} \int_0^1 \left| \nabla u(x_i + s(x - x_i)) \right| \, \mathrm{d}x \, \mathrm{d}x = \sqrt{d} \int_0^1 \int_{C_\rho} \frac{\left| \nabla u(x_i + s(x - x_i)) \right|}{\rho^{d-1}} \, \mathrm{d}x \, \mathrm{d}s \, .$$

This calls for a sensible change of variables. Denote $z = x_i + s(x - x_i)$, then under this transformation the cube C_ρ becomes

$$z \in x_i + s(C_\rho - x_i) = x_i(1 - s) + C_{s\rho} = x_i(1 - s) + [0, s\rho]^d := C_{s\rho}^i$$

which, since x_i is taken from the faces and $s \le 1$, is a cube with its "origin" somewhere in C_ρ and a side of length $s\rho \le \rho$, which implies $C_{s\rho}^i \subset [0,R]^d$ for some R. The integral then becomes (clearly $|\det \nabla_x z| = s^d$),

$$\sqrt{d} \int_{0}^{1} \int_{C_{\rho}} \frac{\left| \nabla u(x_{i} + s(x - x_{i})) \right|}{\rho^{d-1}} \, \mathrm{d}x \, \mathrm{d}s = \sqrt{d} \int_{0}^{1} \int_{C_{s,\rho}^{i}} \frac{\left| \nabla u(z) \right|}{s^{d} \rho^{d-1}} \, \mathrm{d}z \, \mathrm{d}s = \sqrt{d} \rho^{\mu} \int_{0}^{1} s^{\mu-1} \int_{C_{s,\rho}^{i}} \frac{\left| \nabla u(z) \right|}{(s\rho)^{d-1+\mu}} \, \mathrm{d}z \, \mathrm{d}s,$$

where we are being a bit suggestively imaginative. The "deviation estimate" then becomes

$$\left|\frac{1}{\rho^{d}}\int_{C_{\rho}}u(x)\,\mathrm{d}x-u(x_{i})\right| \leq \sqrt{d}\rho^{\mu}\int_{0}^{1}s^{\mu-1}\underbrace{\int_{C_{s\rho}^{i}}\frac{|\nabla u(z)|}{(s\rho)^{d-1+\mu}}\,\mathrm{d}z\,\mathrm{d}s} \leq \sqrt{d}\rho^{\mu}\left[\nabla u\right]_{L_{1,\mu}(\mathbb{R}^{d})}\int_{0}^{1}s^{\mu-1}\,\mathrm{d}s = \frac{\sqrt{d}}{\mu}\rho^{\mu}\left[\nabla u\right]_{L_{1,\mu}(\mathbb{R}^{d})},$$

where we used that $C^i_{s\rho} \subset [0,R]^d$ and that $0 \in \mathbb{R}^d$, and so we could estimate the integral over $C^i_{s\rho}$ by $[\nabla u]_{\mathbf{L}_{1,\mu}(\mathbb{R}^d)}$. Triangle inequality and the fact $\rho \leq |x_1 - x_2|$ concludes our proof:

$$|u(x_1) - u(x_2)| \le \left| \frac{1}{\rho^d} \int_{C_\rho} u(x) \, \mathrm{d}x - u(x_1) \right| + \left| \frac{1}{\rho^d} \int_{C_\rho} u(x) \, \mathrm{d}x - u(x_2) \right| \le \frac{2\sqrt{d}}{\mu} \rho^{\mu} \left[\nabla u \right]_{\mathcal{L}_{1,\mu}(\mathbb{R}^d)} \le \frac{2\sqrt{d}}{\mu} |x_1 - x_2|^{\mu} \left[\nabla u \right]_{\mathcal{L}_{1,\mu}(\mathbb{R}^d)}.$$

Remark. It is sufficient when $u \in C_0^1(\mathbb{R}^d)$.

Gagliardo had in fact two lemmas, so let us even the game for Morrey.

Lemma 8. Let $p \in (d, \infty)$, and let $\mu = 1 - \frac{d}{p}$. Then $\forall u \in \mathcal{D}(\mathbb{R}^d)$ it holds

$$||u||_{C^{0,\mu}(\mathbb{R}^d)} \le \left(1 + \frac{4\sqrt{d}}{\mu}\right) ||u||_{W^{1,p}(\mathbb{R}^d)},$$

where

$$||u||_{C^{0,\mu}(\mathbb{R}^d)} = \sup_{x \in \mathbb{R}^d} |u(x)| + \sup_{x,y \in \mathbb{R}^d, x \neq y} \frac{|u(x) - u(y)|}{|x - y|^{\mu}}.$$

Proof. We prove the assertion by estimating both terms in the above norm. To obtain those specific constants, we will pay some more attention to our proceeding. Let us also state the trivial: $\mu = 1 - \frac{d}{p} \in (0,1)$ for $p \in (d,\infty)$. Begin with the differences: choose an arbitrary $\rho > 0$ and compute

$$\int_{[0,\rho]^d} \frac{|\nabla u(x+y)|}{\rho^{d-1+\mu}} \, \mathrm{d}y \le \left(\int_{[0,\rho]^d} \left(\frac{|\nabla u(x+y)|}{\rho^{d-1+\mu}} \right)^p \, \mathrm{d}y \right)^{\frac{1}{p}} \left(\lambda \left([0,\rho]^d \right) \right)^{\frac{p-1}{p}} = \|\nabla u\|_{\mathrm{L}_p(\mathbb{R}^d)} \frac{\rho^{\frac{d(p-1)}{p}}}{\rho^{d-1+\mu}} = \|\nabla u\|_{\mathrm{L}_p(\mathbb{R}^d)},$$

because $\frac{d(p-1)}{p} - d + 1 - \mu = \frac{dp-d}{p} - d + 1 - 1 + \frac{d}{p} = \frac{dp}{p} - d = 0$. Taking the suprema yields

$$[\nabla u]_{\mathbf{L}_{1,\mu}(\mathbb{R}^d)} \leq \|\nabla u\|_{\mathbf{L}_{\mathbf{D}}(\mathbb{R}^d)}.$$

Going with this into the first Morrey lemma, we see

$$|u(x_1) - u(x_2)| \le \frac{2\sqrt{d}}{\mu} |x_1 - x_2|^{\mu} ||\nabla u||_{\mathbf{L}_{\mathbf{p}}(\mathbb{R}^d)},$$

meaning

$$\sup_{x_1, x_2 \in \mathbb{R}^d, x_1 \neq x_2} \frac{|u(x_1) - u(x_2)|}{|x_1 - x_2|^{\mu}} \le \frac{2\sqrt{d}}{\mu} \|\nabla u\|_{\mathbf{L}_p(\mathbb{R}^d)}.$$

To estimate the infinity norm, we can actually exploit the above result as well: pick $x \neq y \in \mathbb{R}^d$ and write

$$|u(x)| - |u(y)| \le |u(x) - u(y)| \le \frac{2\sqrt{d}}{\mu} \|\nabla u\|_{L_p(\mathbb{R}^d)},$$

and so

$$|u(x)| \le |u(y)| + \frac{2\sqrt{d}}{\mu} \|\nabla u\|_{\mathbf{L}_{\mathbf{p}}(\mathbb{R}^d)}.$$

Now fix $\rho \ge 2|x-y| > 0$, integrate both sides w.r.t y over $[0, \rho]^d$ and obtain

$$|u(x)|\rho^d \le \int_{[0,\rho]^d} |u(y)| \, \mathrm{d}y + \frac{2\sqrt{d}}{\mu} \rho^d \|\nabla u\|_{\mathrm{L}_p(\mathbb{R}^d)},$$

which upon using Holder in the integral becomes

$$|u(x)|\rho^d \le ||u||_{L_p(\mathbb{R}^d)} \rho^{\frac{d(p-1)}{p}} + \frac{2\sqrt{d}}{\mu} \rho^d ||\nabla u||_{L_p(\mathbb{R}^d)}.$$

Since we have lost y, we can in fact choose $\rho = 1$, and upon taking the supremum write

$$\sup_{x \in \mathbb{R}^d} |u(x)| \le ||u||_{\mathcal{L}_p(\mathbb{R}^d)} + \frac{2\sqrt{d}}{\mu} ||\nabla u||_{\mathcal{L}_p(\mathbb{R}^d)},$$

and so in total

$$\|u\|_{\mathbf{C}^{0,\mu}(\mathbb{R}^d)} \leq \|u\|_{\mathbf{L}_{\mathbf{p}}(\mathbb{R}^d)} + \frac{4\sqrt{d}}{\mu} \|\nabla u\|_{\mathbf{L}_{\mathbf{p}}(\mathbb{R}^d)} = \left(1 + \frac{4\sqrt{d}}{\mu}\right) \|u\|_{\mathbf{W}^{1,p}(\mathbb{R}^d)}.$$

Remark. Since $\mathcal{D}(\mathbb{R}^d)$ is dense in $W^{1,p}(\mathbb{R}^d)$, the above lemma holds also for $u \in W^{1,p}(\mathbb{R}^d)$. We have to be careful to pick a good representant though.

Theorem 10 (Embedding theorems for p > d). Let $\Omega \in C^{0,1}, d \in \mathbb{N}, p > d$, i.e., $p \in (d, \infty]$. Denote $\mu^* = 1 - \frac{d}{p} \in (0, 1)$. Then

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*],$$

and

$$W^{1,p}(\Omega) \hookrightarrow \hookrightarrow C^{0,\alpha}\left(\overline{\Omega}\right), \forall \alpha \in [0,\mu^*).$$

Proof. Ad continuous:

Since $\Omega \in \mathbb{C}^{0,1}$, we are able to use the extension theorem; recall $\forall u \in W^{1,p}(\Omega) : \operatorname{supp} Eu \subset V$, where $\overline{\Omega} \subset V$. Let us deal with the case $p \in (d, \infty)$ first. We have shown

$$\|u\|_{\mathbf{C}^{0,\mu^*}(\overline{\Omega})} \le \|u\|_{\mathbf{C}^{0,\mu^*}(\mathbb{R}^d)} \le \left(1 + \frac{4\sqrt{d}}{\mu^*}\right) \|u\|_{\mathbf{W}^{1,p}(\mathbb{R}^d)}, \forall u \in \mathbf{W}^{1,p}(\mathbb{R}^d).$$

Realize that in fact

$$||u||_{\mathcal{C}^{0,\mu^*}(\overline{\Omega})} = ||Eu||_{\mathcal{C}^{0,\mu^*}(\overline{\Omega})},$$

as $\partial\Omega$ is a set of zero Lebesgue measure and so in fact Eu = u on $\overline{\Omega}$, which together with the obvious fact $Eu \in W^{1,p}(\mathbb{R}^d)$ gives

$$||u||_{\mathcal{C}^{0,\mu^*}(\overline{\Omega})} = ||Eu||_{\mathcal{C}^{0,\mu^*}(\overline{\Omega})} \le \left(1 + \frac{4\sqrt{d}}{\mu^*}\right) ||Eu||_{\mathcal{W}^{1,p}(\mathbb{R}^d)} \le C||u||_{\mathcal{W}^{1,p}(\Omega)}.$$

This exactly means

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\mu^*}(\overline{\Omega}).$$

Realize also that

$$\mathbf{C}^{0,\mu^{*}}\left(\overline{\Omega}\right)\hookrightarrow\mathbf{C}^{0,\alpha}\left(\overline{\Omega}\right),\forall\alpha\in\left[0,\mu^{*}\right],$$

and so

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\mu^*}\left(\overline{\Omega}\right) \hookrightarrow C^{0,\alpha}\left(\overline{\Omega}\right), \forall \alpha \in [0,\mu^*].$$

If now $p = \infty$, realize that (by embedding of Lebesgue spaces)

$$W^{1,\infty}(\Omega) \hookrightarrow W^{1,q}(\Omega), \forall q \in [1,\infty).$$

From the previous result it follows

$$W^{1,q}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in \left[0, 1 - \frac{d}{q}\right],$$

and notice that $1 - \frac{d}{q} \to 1$ as $q \to \infty$. This means that $\forall q \in [1, \infty)$ it holds

$$\mathrm{W}^{1,\infty}(\Omega) \hookrightarrow \mathrm{W}^{1,q}(\Omega) \hookrightarrow \mathrm{C}^{0,\alpha}\left(\overline{\Omega}\right), \forall \alpha \in \left[0,1-\frac{d}{q}\right].$$

Since $q \in [1, \infty)$ was arbitrary, we conclude it must be

$$W^{1,\infty}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,1].$$

19

Ad compactness This will be a bit of a cheating: we know

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\beta}(\overline{\Omega}), \forall \beta \in [0,\mu^*],$$

and for Holder spaces it also holds

$$C^{0,\beta}(\overline{\Omega}) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\beta),$$

which means if we choose $\beta = \mu^*$, we in fact obtain

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\mu^*}(\overline{\Omega}) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*).$$

Using the same arguments as in the case of the compact embedding for p < d, we can conclude

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*).$$

We are done. \Box

Remark. Note that in the case of p > d, from

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*),$$

 and^{20}

$$C^{0,\alpha}(\overline{\Omega}) \hookrightarrow L_{\infty}(\Omega), \forall \alpha \in [0,1]$$

$$\|u\|_{C^{0,1-\frac{d}{q}}(\overline{\Omega})} = \sup_{x \in \overline{\Omega}} |u(x)| + \sup_{x_1 \neq x_2 \in \overline{\Omega}} \frac{|u(x_1) - u(x_2)|}{|x_1 - x_2|^{1-\frac{d}{q}}},$$

actually allows one to pass to the limit $q \to \infty$, since the supremum is independent of the exponent in the denonimanotor, the function on the RHS is continuous. So if we know $\|u\|_{\mathbf{C}^{0,1-\frac{d}{q}}(\overline{\Omega})} \le C\|u\|_{\mathbf{W}^{1,\infty}(\Omega)}, \forall q \in [1,\infty)$, we can

pass to the limit on the LHS and obtain $\|u\|_{C^{0,1}\left(\overline{\Omega}\right)} \le C\|u\|_{W^{1,\infty}(\Omega)}$, which is the only missing possibility.

²⁰Clearly,

$$\|u\|_{\mathcal{L}_{\infty}(\Omega)} \leq \|u\|_{\mathcal{C}^{0,\alpha}\left(\overline{\Omega}\right)} = \|u\|_{\mathcal{L}_{\infty}(\Omega)} + \sup_{x_1 \neq x_2} \frac{|u(x_1) - u(x_2)|}{|x_1 - x_2|^{\alpha}}.$$

¹⁹The norm

it follows²¹

$$W^{1,p}(\Omega) \hookrightarrow L_{\infty}(\Omega), \forall p > d.$$

But that of course means (Ω is bounded) that

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, \infty],$$

whenever p > d.

Remark (Summary). Let us summarize the obtained results. If $d \in \mathbb{N}, \Omega \in \mathbb{C}^{0,1}$, then upon denoting

$$p^* = \frac{dp}{d-p}, \mu^* = 1 - \frac{d}{p},$$

it holds

• if p < d, then

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, p^*],$$

and

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, p^*),$$

• if p = d, then

$$W^{1,d}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, \infty)$$

and

$$W^{1,d}(\Omega) \hookrightarrow L_q(\Omega), \forall q \in [1, \infty),$$

• if p > d, then

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*],$$

and

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}\left(\overline{\Omega}\right), \forall \alpha \in [0,\mu^*),$$

which also imply

$$W^{1,p}(\Omega) \hookrightarrow L_{\infty}(\Omega)$$
,

and

$$W^{1,p}(\Omega) \hookrightarrow L_{\infty}(\Omega)$$
.

Remark (Summary - embedding into Lebesgue spaces). It can be guiding to look only at the embeddings into some Lebesgue spaces. Let $d \in \mathbb{N}, \Omega \in \mathbb{C}^{0,1}$, denote

$$p^* = \frac{dp}{d-p}, \mu^* = 1 - \frac{d}{p}.$$

Then it holds

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega)$$
,

where q is given:

²¹Again, composition of a compact and continuous (linear) operators yields a compact operator independently of the order.

- if p < d, then $q \in [1, p^*]$,
- if p = d, then $q \in [1, \infty)$,
- if p > d, then $q \in [1, \infty]$.

Also, it holds

$$W^{1,p}(\Omega) \hookrightarrow L_q(\Omega)$$
,

where q is given as

- if p < d, then $q \in [1, p^*)$,
- if p = d, then $q \in [1, \infty)$,
- if p > d, then $q \in [1, \infty]$.

2.5 Trace theorems

There are many many troubles with the boundary. Another one we have yet not encountered arises with e.g. homogenous Dirichlet boundary conditions: it should hold

$$u = 0 \text{ on } \partial \Omega$$
,

but typically, u is an element of some Sobolev space on Ω , and $\lambda_d(\partial\Omega) = 0$. We cannot sensibly talk about pointwise values on a set of measure zero, they can be arbitrary. This can be dealt with provided - as expected - when Ω , *i.e.*, $\partial\Omega$ is benevolent enough.

Realize also that for Ω at least $C^{0,0}$ we also have the density of $C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$ in $W^{1,p}(\Omega)$, meaning the values on $\partial\Omega$ are well defined at least for a dense subset of $W^{1,p}(\Omega)$. It should not be too difficult to extend to the whole $W^{1,p}(\Omega)$, right...?

difficult to extend to the whole $W^{1,p}(\Omega)$, right...? Moreover, in the case $p > d, \Omega \in \mathbb{C}^{0,1}$ we already know $\forall u \in W^{1,p}(\Omega)$ there exists $u^* \in \mathbb{C}^0(\overline{\Omega})$, such that $u = u^*$ a.e. in Ω , and so in these cases, the values $u^* \upharpoonright_{\partial\Omega}$ are well defined. What if $p \leq d$? Remark (The space $L_p(\mathcal{H}_{d-1}, \partial\Omega)$). In the winter semester, we have defined

$$L_p(\partial\Omega) \equiv L_p(\mathcal{H}_{d-1},\partial\Omega)$$
,

i.e., the lebesgue spaces are taken w.r.t the d-1 dimensional (normalized complete) Hausdorff measure \mathcal{H}_{d-1} .

Theorem 11 (Continuous trace theorem). Let $\Omega \in C^{0,1}$, $p \in [1, \infty]$, denote $p^{\#} = \frac{dp-p}{d-p}$. Then there is a continuous linear operator $\operatorname{tr}: W^{1,p}(\Omega) \to L_q(\partial\Omega)$, with q being

- if p < d, then $q \in [1, p^{\#}]$,
- if p = d, then $q \in [1, \infty)$,
- if p > d, then $q \in [1, \infty]$.

Moreover, $\forall u \in C^{\infty}(\overline{\Omega})$ it holds

$$\operatorname{tr} u = u \upharpoonright_{\partial \Omega}$$
.

meaning $\operatorname{tr}: W^{1,p}(\Omega) \to L_p(\partial\Omega)$ is an extension of $\widetilde{\operatorname{tr}}: C^{\infty}(\overline{\Omega}) \to C^0(\partial\Omega)$.

Proof. The strategy is the following

- 1. define tr for smooth functions,
- 2. obtain estimates for tr using embedding theorems,
- 3. extend tr to the whole space, which defines tr.

Case p < d:

As we have mentioned, the case for functions smooth up to the boundary is evident. Let us so define $\tilde{\mathrm{tr}}: \mathrm{C} \frac{\infty}{\Omega} (\mathbb{R}^d) \to \mathrm{C}^0 (\partial \Omega)$, by

$$\tilde{\operatorname{tr}} u = u \upharpoonright_{\partial\Omega}$$
.

Then clearly $\tilde{\text{tr}}$ is a well defined linear continuous 22 operator.

(We are using the notation from the definition of a $C^{0,1}$ domain). Let us for clarity define (and also recall)

$$G_{j} = \mathbb{A}_{j}(\{(x', a_{j}(x')|x' \in U(0, \alpha)\}),$$

$$G_{j}^{+} = \mathbb{A}_{j}(\{x', a_{j}(x') + b|x' \in U(0, \alpha), b \in (0, \beta)\}),$$

$$G_{j}^{-} = \mathbb{A}_{j}(\{x', a_{j}(x') - b|x' \in U(0, \alpha), b \in (0, \beta)\}).$$

Within this notation, $G_j \subset \partial\Omega$, $G_j^+ \subset \Omega$, $G_j^- \subset \mathbb{R}^d/\overline{\Omega}$ and $U_j = G_j \cup G_j^+ \cup G_j^-$. Moreover, $\{U_j\}_{j=1}^m$ are open sets s.t. $\partial\Omega \subset \bigcup_{j=1}^m U_j$. Denote $\{\varphi_j\}_{j=1}^m \subset \mathcal{D}\left(\mathbb{R}^d\right)$ to be the partition of unity subordinate to this (open) covering. Realize moreover that since $\mathcal{H}_{d-1}(\partial\Omega) < \infty$, it holds

$$L_{n^{\#}}(\partial\Omega) \hookrightarrow L_{q}(\partial\Omega), \forall q \in [1, p^{\#}].$$

So if we are able to show

$$||u||_{\mathcal{L}_{p\#}(\partial\Omega)} \le C||u||_{\mathcal{W}^{1,p}(\Omega)},$$

we have the rest of the estimates for free.

Take $u \in C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d)$, and denote $u_j = u\varphi_j, j \in \{1, \dots, m\}$. Let for the moment p > 1, so $p^{\#} = \frac{dp-p}{d-p} > \frac{d-1}{d-1} = 1$. As $u_j \in C^{\infty}(\mathbb{R}^d)$, it holds $u_j \in C^1(\overline{G}_j^+)$. Moreover, since $\sup u_j \subset U_j$ and as $U_j \cap \mathbb{A}_j(\{(x', a_j(x') + b | x' \in U(0, \alpha), b \in [0, \infty)\}) = \emptyset$, it holds

$$u_j(\mathbb{A}_j(x',a_j(x')+\beta))=0.$$

With those qualities, if we denote (for an arbitrary $j \in \{1, ..., m\}$; this will become $\|u_j\|_{\mathbf{L}_{p\#}(\partial\Omega)}$)

$$v(x') = |u_j(\mathbb{A}_j(x', a_j(x')))|^{p^{\#}} = |u_j(\mathbb{A}_j(x', a_j(x')))|^{\frac{dp-p}{d-p}},$$

²²Even though $C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) = \{u \upharpoonright_{\overline{\Omega}} | u \in C^{\infty}(\mathbb{R}^d)\}$ is not a normed space, it is a Frechet space, and so the notion of continuity is that of a topological vector space.

we can write (recall \mathbb{A}_j is orthogonal and $x' \in \mathrm{U}(0,\alpha)$)

$$|v(x')| = \left| |u_{j}(\mathbb{A}_{j}(x', a_{j}(x')))|^{\frac{dp-p}{d-p}} - |u_{j}(\mathbb{A}_{j}(x', a_{j}(x') + \beta))|^{\frac{dp-p}{d-p}} \right| \leq \left| \int_{a_{j}(x') + \beta}^{a_{j}(x')} \frac{\partial}{\partial s} |u_{j}(\mathbb{A}_{j}(x', s))| \, \mathrm{d}s \right| =$$

$$= \left| \int_{a_{j}(x') + \beta}^{a_{j}(x')} p^{\#} |u_{j}(\mathbb{A}_{j}(x', s))|^{\frac{dp-d}{d-p}} \operatorname{sign} (u_{j}(\mathbb{A}_{j}(x', s))) \nabla u_{j}(\mathbb{A}_{j}(x', s)) \cdot \mathbb{A}_{j}(x', 1) \, \mathrm{d}s \right| \leq$$

$$\leq p^{\#} \int_{a_{j}(x')}^{a_{j}(x') + \beta} |u_{j}(\mathbb{A}_{j}(x', s))|^{\frac{dp-d}{d-p}} |\nabla u_{j}(\mathbb{A}_{j}(x', s))| \underbrace{|\mathbb{A}_{j}(x', 1)|}_{=|(x', 1)|} \, \mathrm{d}s \leq$$

$$\leq p^{\#} \sqrt{1 + \alpha^{2}} \int_{a_{j}(x')}^{a_{j}(x') + \beta} |u_{j}(\mathbb{A}_{j}(x', s))|^{\frac{dp-d}{d-p}} |\nabla u_{j}(x', s)| \, \mathrm{d}s.$$

Integrate this inequality over $U(0,\alpha)$ and write (recall the definition of G_j^+ , we are using Fubini)

$$\int_{\mathrm{U}(0,\alpha)} |v(x')| \, \mathrm{d}x' \leq p^{\#} \sqrt{1 + \alpha^{2}} \int_{\mathrm{U}(0,\alpha)} \int_{a_{j}(x')}^{a_{j}(x') + \beta} |u_{j}(\mathbb{A}_{j}(x',s))|^{\frac{dp-d}{d-p}} |\nabla u_{j}(\mathbb{A}_{j}(x',s))| \, \mathrm{d}s \, \mathrm{d}x' \leq \\
\leq p^{\#} \sqrt{1 + \alpha^{2}} \int_{\mathbb{A}_{j}(\{(x',a_{j}(x') + b)|x' \in \mathrm{U}(0,\alpha),b \in [0,\beta]\})} |u_{j}|^{\frac{dp-d}{d-p}} |\nabla u_{j}(x)| \, \mathrm{d}x = \\
= p^{\#} \sqrt{1 + \alpha^{2}} \int_{G_{j}^{+}} |u_{j}(x)|^{\frac{dp-d}{d-p}} |\nabla u(x)| \, \mathrm{d}x \leq p^{\#} \sqrt{1 + \alpha^{2}} \|\nabla u\|_{\mathrm{L}_{p}\left(G_{j}^{+}\right)} \||u_{j}|^{\frac{dp-d}{d-p}} \|_{\mathrm{L}_{p}\left(G_{j}^{+}\right)},$$

and since $\frac{dp-d}{d-p}p' = \frac{dp-d}{d-p}\frac{p}{p-1} = \frac{dp}{d-p} = p^*$, we have

$$\int_{\mathrm{U}(0,\alpha)} |v(x')| \, \mathrm{d}x' = p^{\#} \sqrt{1 + \alpha^2} \|\nabla u\|_{\mathrm{L}_p\left(G_j^+\right)} \|u_j\|_{\mathrm{L}_{p^*}\left(G_j^+\right)}^{\frac{dp-d}{d-p}}.$$

Since $G_j^+ \in \mathbb{C}^{0,1}$, the last term can be estimated using the continuous embedding theorems:

$$\|u_j\|_{\mathrm{L}_p*\left(G_i^+\right)}^{\frac{dp-d}{d-p}} \le C\|u_j\|_{\mathrm{W}^{1,p}\left(G_i^+\right)}^{\frac{dp-d}{d-p}},$$

whereas the integral on the LHS actually is

$$\int_{\mathrm{U}(0,\alpha)} |v(x')| \, \mathrm{d}x' = \int_{\mathrm{U}(0,\alpha)} \left| u_j(\mathbb{A}_j(x',a_j(x'))) \right|^{p^\#} \, \mathrm{d}x = \int_{\mathbb{A}_j(\{(x',a_j(x')|x'\in\mathrm{U}(0,\alpha)\})} \left| u_j(x) \right|^{p^\#} \, \mathrm{d}x = \left\| u_j \right\|_{\mathrm{L}_{p^\#}(G_j)}^{p^\#},$$

and so we write

$$\|u_j\|_{\mathrm{L}_p\#(G_j)}^{p^\#} \leq C \|\nabla u_j\|_{\mathrm{L}_p\left(G_j^+\right)} \|u_j\|_{\mathrm{W}^{1,p}\left(G_j^+\right)}^{\frac{dp-d}{d-p}} \geq C \|u_j\|_{\mathrm{W}^{1,p}\left(G_j^+\right)}^{\frac{dp-d+d-p}{d-p}} = C \|u_j\|_{\mathrm{W}^{1,p}\left(G_j^+\right)}^{p^\#},$$

and so

$$||u_j||_{\mathcal{L}_{p\#}(G_j)} \le C||u_j||_{\mathcal{W}^{1,p}(G_j^+)}.$$

This has been done for p > 1, but in fact taking the limit $p \to 1^+$ is allowed here (without a proof). Hence the above estimate holds $\forall p \in [1, d)$.

The estimates have so far been local - let us glue them together. Recall $\partial \Omega = \bigcup_{j=1}^m G_j, G_j^+ \subset \Omega$, and so

$$\|u\|_{\mathcal{L}_{p\#}(\partial\Omega)} = \left\| \sum_{j=1}^{m} u_{j} \right\|_{\mathcal{L}_{p\#}(\partial\Omega)} \leq \sum_{j=1}^{m} \|u_{j}\|_{\mathcal{L}_{p\#}(\partial\Omega)} = \sum_{j=1}^{m} \|u_{j}\|_{\mathcal{L}_{p}(\operatorname{supp} u_{j} \cap \partial\Omega)} = \sum_{j=1}^{m} \|u_{j}\|_{\mathcal{L}_{p}(G_{j})} \leq C \|u\|_{\mathcal{W}^{1,p}(\Omega)},$$

where we have used the fact $0 \le \varphi_j \le 1$ in the last inequality. And so we have shown

$$\|u\|_{\mathcal{L}_{n\#}(\partial\Omega)} \leq \|u\|_{\mathcal{W}^{1,p}(\Omega)}, \forall u \in \mathcal{C}^{\infty}_{\overline{\Omega}}\left(\mathbb{R}^d\right).$$

Now let $u \in W^{1,p}(\Omega)$ be arbitrary. Since $\Omega \in C^{0,1}$, there $\exists \{u_k\} \subset C^{\infty}_{\overline{\Omega}}(\mathbb{R}^d) \ s.t. \ u_k \to u \text{ in } W^{1,p}(\Omega)$.

$$\operatorname{tr} u = \lim_{k \to \infty} \operatorname{tr} u_k.$$

The definition is sensible, as $\tilde{\text{tr}}$ is continuous and $\{u_k\}$ converges. Also, from the arithmetic of the limits and linearity of $\tilde{\text{tr}}$ we see tr is linear. Next, check

$$\|\operatorname{tr} u\|_{\operatorname{L}_{q}(\partial\Omega)} = \left\| \lim_{k \to \infty} \operatorname{\tilde{tr}} u_{k} \right\|_{\operatorname{L}_{q}(\partial\Omega)} = \lim_{k \to \infty} \|u_{k}|_{\operatorname{L}_{q}(\partial\Omega)} \leq C \lim_{k \to \infty} \|u_{k}\|_{\operatorname{W}^{1,p}(\Omega)} = C \|u\|_{\operatorname{W}^{1,p}(\Omega)}, \forall q \in [1, p^{\#}].$$

and so inded tr: $W^{1,p}(\Omega) \to L_q(\partial\Omega)$, $\forall q \in [1, p^{\#}]$ and it surely is bounded.

Case p = d

In this case, we have id $\in \mathcal{L}(W^{1,d}(\Omega), W^{1,r}(\Omega)), \forall r \in [1,d)$ and the previous result tells us $\operatorname{tr} \in \mathcal{L}(W^{1,r}(\Omega), L_q(\partial\Omega)), \forall q \in [1,r^{\#}]$. Observe that $r^{\#} = \frac{dr-r}{d-r} \to \infty$ as $r \to d^-$, meaning $\forall q \in [1,\infty)$ there exists $r \in [1,d)$ s.t. $r^{\#} > q$, i.e. $q \in [1,r^{\#})$, which in fact means

$$\operatorname{tr} \in \mathcal{L}(W^{1,r}(\Omega), L_q(\partial \Omega)), \forall r \in [1, d), \forall q \in [1, \infty).$$

But then $\operatorname{tr} \circ \operatorname{id} : \operatorname{W}^{1,d}(\Omega) \to \operatorname{L}_q(\partial\Omega)$ is a continous linear operator $\forall q \in [1, \infty)$, as it as a composition of continuous linear operators.

 $Case \ p > d$

This is the easiest case: we know that $W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu^*]$, so in particular

$$W^{1,p}(\Omega) \hookrightarrow C^0\left(\overline{\Omega}\right) \subset C^0\left(\partial\Omega\right) \subset L_\infty\left(\partial\Omega\right),$$

and so in total

$$W^{1,p}(\Omega) \hookrightarrow L_{\infty}(\partial\Omega)$$
,

which together with the fact $(\mathcal{H}_{d-1}(\partial\Omega) < \infty)$

$$L_{\infty}(\partial\Omega) \hookrightarrow L_{q}(\partial\Omega), \forall q \in [1, \infty),$$

concludes the proof.

Remark. These results are very similiar to the results obtained in the case of embedding theorems and it is not surprising, since it might seem we have in fact shown the embeddings of some Sobolev spaces into some Lebesgue spaces. One needs to be careful however, as it is not an embedding - we are taking Ω open, so $\partial\Omega \notin \Omega$. It only makes sense in the case of p > d.

The chapter will be concluded by stating the compact analogue to the embedding theorems.

Theorem 12 (Compact trace theorem). Let $d \in \mathbb{N}, \Omega \in C^{0,1}$, denote $p^{\#} = \frac{dp-p}{d-p}$, and let tr be the trace operator from the previous theorem. Then

$$\operatorname{tr} \in \mathcal{K}(W^{1,p}(\Omega), L_q(\partial \Omega)),$$

where q is

- if p < d, then $q \in [1, p^{\#})$,
- if p = d, then $q \in [1, \infty)$,
- if p > d, then $q \in [1, \infty]$,

Proof. Case p < d: Let us adopt the custom that when talking about the properties of $u \in W^{1,p}(\Omega)$, in the space $L_q(\partial\Omega)$, we are always talking about the properties of tru in $L_q(\partial\Omega)$...

It will be pretty similar to the continuous case, so let us skip only to the key estimate. We are not apriori sure in which space we will be able to comfortably show the compactness, so let first $q \in [1, \infty)$ and compute. Then we might use some interpolation estimates...

$$\int_{\mathrm{U}(0,\alpha)} |u_{j}(\mathbb{A}_{j}(x',a_{j}(x')))|^{q} dx' \leq \left| \int_{\mathrm{U}(0,\alpha)} \int_{a_{j}(x')}^{a_{j}(x')+\beta} \frac{\partial}{\partial s} |u_{j}(\mathbb{A}_{j}(x',s))|^{q} ds dx' \right| \leq
\leq q\sqrt{1+\alpha^{2}} \int_{\mathrm{U}(0,\alpha)} \int_{a_{j}(x')}^{a_{j}(x')+\beta} |u_{j}(\mathbb{A}_{j}(x',s))| |\nabla u_{j}(\mathbb{A}_{j}(x',s))| ds dx' \leq
\leq q\sqrt{1+\alpha^{2}} \int_{G_{j}^{+}} |u_{j}(x)|^{q-1} |\nabla u_{j}(x)| dx \leq q\sqrt{1+\alpha^{2}} \|\nabla u_{j}\|_{\mathrm{L}_{q}(G_{j}^{+})} \|u_{j}\|_{\mathrm{L}_{q'(q-1)}(G_{j}^{+})}^{q-1},$$

where $q'(q-1) = \frac{q}{q-1}(q-1) = q$, so all in all

$$\|u_j\|_{\mathcal{L}_q(G_j)} \le C(q,\Omega) \|\nabla u_j\|_{\mathcal{L}_q(G_j^+)}^{\frac{1}{q}} \|u_j\|_{\mathcal{L}_q(G_j^+)}^{1-\frac{1}{q}} \le C(q,\Omega) \|u_j\|_{\mathcal{W}^{1,q}(G_j^+)}^{\frac{1}{q}} \|u_j\|_{\mathcal{L}_q(G_j^+)}^{1-\frac{1}{q}}$$

which leads to

$$||u||_{\mathcal{L}_{q}(\partial\Omega)} = \left|\left|\sum_{j=1}^{m} u_{j}\right|\right|_{\mathcal{L}_{q}(\partial\Omega)} \leq \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}(\operatorname{supp} u_{j} \cap \partial\Omega)} \leq \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}(G_{j})} \leq C \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}(G_{j})} \leq C \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}(G_{j})} \leq C \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}(\Omega)} \leq C \sum_{j=1}^{m} ||u_{j}||_{\mathcal{L}_{q}$$

Denote $U = U_{W^{1,p}(\Omega)}(0,1)$; we will show tr U is totally bounded in $L_q(\partial\Omega)$ for some $q \in [1,\infty)$. Let $\varepsilon > 0$ be given. Realize that $\forall p \in [1,d)$ it is $p < p^*$, and so it always holds $W^{1,p}(\Omega) \hookrightarrow L_p(\Omega)$. For the moment, we pick q = p. Denote $\{u_k\}_{k=1}^m$ to be the δ -net from U in $L_p(\Omega)$, where δ will be chosen suitably later. Let now $u \in U$ be arbitrary and find $u_i \in U$ s.t. $||u - u_i||_{L_p(\Omega)} \leq \delta$. Using the estimate from above we have

$$||u - u_i||_{\mathbf{L}_p(\partial\Omega)} \le C_1 ||u - u_i||_{\mathbf{W}^{1,p}(\Omega)}^{\frac{1}{q}} ||u - u_i||_{\mathbf{L}_p(\Omega)}^{1 - \frac{1}{q}} \le C_1 2^{\frac{1}{q}} \delta^{1 - \frac{1}{q}},$$

where we have used the fact $u, u_i \in U$. We see that upon choosing

$$\delta < \left(\frac{\varepsilon}{C_1 2^{\frac{1}{q}}}\right)^{\frac{1}{1-q}},$$

we in fact have

$$\|u-u_i\|_{\mathrm{L}_{\mathrm{D}}(\partial\Omega)}<\varepsilon,$$

and so $\{\operatorname{tr} u_i\}_{i=1}^m \subset U$ is a ε -net in $L_p(\partial\Omega)$, meaning

$$\operatorname{tr} \in \mathcal{K}(W^{1,p}(\Omega), L_p(\partial \Omega))$$

Since now $L_p(\partial\Omega) \hookrightarrow L_q(\partial\Omega)$, $\forall q \in [1, p]$, we have also shown

$$\operatorname{tr} \in \mathcal{K}(W^{1,p}(\Omega), L_q(\partial \Omega)), \forall q \in [1, p].$$

The remaining case is when $q \in (p, p^{\#})$. As in the case of compact embedding of Sobolev spaces, a suitable interpolation theorem will do the job for us. It holds

$$||u||_{\mathcal{L}_q(\partial\Omega)} \le ||u||_{\mathcal{L}_p(\partial\Omega)}^{\theta} ||u||_{\mathcal{L}_p\#(\partial\Omega)}^{1-\theta},$$

where $\frac{1}{q} = \frac{\theta}{p} + \frac{1-\theta}{p^{\#}}$. Let now $\{u_i\}_{i=1}^m \subset U$ be such that $\{\operatorname{tr} u_i\}_{i=1}^m$ is the β -net in $L_p(\partial\Omega)$ whose existence we have just proven $\forall \beta > 0$. Recall also that since U is bounded and $\operatorname{tr} \in \mathcal{L}(W^{1,p}(\Omega), L_q(\partial\Omega)) \forall q \in [1, p^{\#}]$, there exists $0 < C_2 < \infty$ s.t.

$$||u||_{\mathcal{L}_q(\partial\Omega)} \le C_2, \forall u \in U.$$

and so $||u||_{\mathcal{L}_{n\#}(\partial\Omega)} \leq C_2, \forall u \in U$ in particular.

Finally, $\forall \in U$ it holds

$$\|u - u_i\|_{\mathbf{L}_q(\partial\Omega)} \le \|u - u_i\|_{\mathbf{L}_p(\partial\Omega)}^{\theta} \|u - u_i\|_{\mathbf{L}_{-\#}(\partial\Omega)}^{1-\theta} \le \beta^{\theta} (2C_2)^{1-\theta},$$

so if we choose

$$\beta < \left(\frac{\varepsilon}{(2C_2)^{1-\theta}}\right)^{\frac{1}{\theta}},$$

then

$$||u - u_i||_{L_q(\partial\Omega)} \le \varepsilon, \forall u \in U.$$

which concludes the proof $\{\operatorname{tr} u_i\}_{i=1}^m$ is an ε -net in U in $L_q(\partial\Omega)$ also for $q \in (p, p^{\#})$. In total, we have showed the compactness of the trace operator for all $q \in [1, p^{\#})$.

Case p = d

In this case $\operatorname{tr} \in \mathcal{L}(W^{1,d}(\Omega), L_q(\partial\Omega)), \forall q \in [1, \infty)$. We also know $\operatorname{id} \in \mathcal{L}(W^{1,d}(\Omega), W^{1,r}(\Omega)), \forall r \in [1, d)$ and that

 $\operatorname{tr} \in \mathcal{K}(W^{1,r}(\Omega), L_q(\partial \Omega)), \forall q \in [1, r^{\#}).$

Repating the same arguments, we see $r^{\#} \to \infty$ as $r \to d^-$, meaning $\forall q \in [1, \infty)$ there exists $r \in [1, d)$ s.t. $r^{\#} > q$, and consequently this implies

$$\forall q \in [1, \infty) \exists r \in [1, d) \text{ s.t. } \text{tr} \in \mathcal{K}(\mathbf{W}^{1,r}(\Omega), \mathbf{L}_q(\partial \Omega)).$$

But then the operator $\operatorname{tr} \circ \operatorname{id} : \operatorname{W}^{1,d}(\Omega) \to \operatorname{L}_q(\partial \Omega)$ is compact $\forall q \in [1, \infty)$, as it is a composition of a (linear) continuous and compact operator.

Case p > d

This case is again trivial: from the embedding theorems, it holds

$$W^{1,p}(\Omega) \hookrightarrow C^{0,\alpha}(\overline{\Omega}), \forall \alpha \in [0,\mu),$$

so in particular

$$W^{1,p}(\Omega) \hookrightarrow C^0(\overline{\Omega}) \subset C^0(\partial\Omega) \subset L_{\infty}(\partial\Omega)$$
,

meaning

$$W^{1,p}(\Omega) \hookrightarrow L_{\infty}(\partial\Omega)$$
,

which together with the embedding

$$L_q(\partial\Omega) \hookrightarrow L_\infty(\partial\Omega), \forall q \in [1, \infty).$$

completes the proof for any $q \in [1, \infty]$. We are done once again.

2.6 Fine properties of Sobolev spaces

In this last chapter, we present some other useful properties of Sobolev spaces.

2.6.1 Composition of Sobolev functions

In the chapter about extension of functions from Sobolev spaces we have seen: $U, V \subset \mathbb{R}^d$ open, $u \in W^{1,p}(U), \Phi : U \to V$ a C¹-diffemorphism $\Rightarrow u \circ \Phi \in W^{1,p}(V)$. Is there any other class of mappings that guarantee the composition remains in some Sobolev spaces?

Theorem 13 (Derivative of superposition). Let $\Omega \subset \mathbb{R}^d$ open, $p \in [1, \infty]$, $u : \Omega \to \mathbb{R}^d$ be in $W^{1,p}(\Omega)$. Denote for an arbitrary $a \in \mathbb{R}$ the set

$$\Omega_a = \{ x \in \Omega | u(x) = a \}.$$

Then

1. $\nabla u = 0$ on Ω_a ,

2. if $f \in C^{0,1}(\mathbb{R}^d)$ s.t. $||f||_{L_{\infty}(\Omega)} < \infty$ (it is a Lipschitz continuous function), then $f \circ u - f(0) \in W^{1,p}(\Omega)$ and it holds

$$\nabla(f \circ u) = \begin{cases} (f' \circ u) \nabla u, & a.e. \ in \{u \notin S\}, \\ 0, & a.e. \ in \{u \in S\} \end{cases},$$

where

$$S = \{s \in \mathbb{R} | f'(s) \ does \ not \ exist\}$$

(in the strong sense).

Proof. The proof has been presented for the case $f \in C^1(\mathbb{R})$, $||f||_{L_{\infty}(\mathbb{R})} < \infty$. In the general setting, one can play with *a.e.* convergence and Rademacher theorem.

Denote $L = \|f\|_{\mathcal{L}_{\infty}(\mathbb{R})}$. Since f is continuous, $f \circ u$ is measurable. Moreover, from the Lipschitzity on the whole \mathbb{R} it follows

$$|(f \circ u)(x) - f(0)| \le L|u(x) - 0| = L|u(x)|,$$

and since $u \in L_p(\Omega)$, also $f \circ u - f(0) \in L_p(\Omega)$. To obtain the wanted result, we need to show $\nabla (f \circ u)$ exists, so let us move on to the second claim. The strategy is to work with some regularization and then pass to the limit with the support size. In concrete terms, pick $\varphi \in \mathcal{D}(\Omega)$, and regularization $u_{\varepsilon} s.t.$ dist (supp $\varphi, \partial \Omega$) > 2ε . Then we can write

$$-\int_{\Omega} (f \circ u_{\varepsilon})(x) \partial_{i} \varphi(x) dx = \int_{\Omega} (f' \circ u_{\varepsilon})(x) \partial_{i} u_{\varepsilon}(x) \varphi dx,$$

using per partes and chain rules (those are strong derivatives). Now we would like to pass to the limit $\varepsilon \to 0^+$. Take the LHS:

$$\lim_{\varepsilon \to 0^+} |\int_{\Omega} (f \circ u_{\varepsilon} - f \circ u) \partial_i \varphi \, \mathrm{d}x| \leq \lim_{\varepsilon \to 0^+} \int_{\Omega} |f \circ u_{\varepsilon} - f \circ u| |\partial_i \varphi| \, \mathrm{d}x \leq L \|\varphi\|_{\mathrm{W}^{1,\infty}(\Omega)} \lim_{\varepsilon \to 0^+} \int_{\Omega \cap \mathrm{supp} \, \varphi} |u_{\varepsilon} - u| \, \mathrm{d}x = 0,$$

as $u_{\varepsilon} \to u$ in $L_1(\Omega \cap \operatorname{supp} \varphi)$ (notice from the theorem on mollification we actually obtain this convergence in $L_1(\Omega_{\varepsilon})$, but we have made a good choice of φ) The RHS can be manipulated

$$\lim_{\varepsilon \to 0^{+}} \left| \int_{\Omega} (f' \circ u_{\varepsilon}) \partial_{i} u_{\varepsilon} \varphi - (f' \circ u) \partial_{i} u \varphi \, dx \right| \leq \lim_{\varepsilon \to 0^{+}} \int_{\Omega} \left| (f' \circ u_{\varepsilon} - f' \circ u) \| \partial_{i} u \| \varphi \right| dx + \lim_{\varepsilon \to 0^{+}} \int_{\Omega} \left| f' \circ u_{\varepsilon} \| \partial_{i} u_{\varepsilon} - \partial_{i} u \| \varphi \right| dx \leq \\
\leq \|\varphi\|_{\mathcal{L}_{\infty}(\Omega)} \lim_{\varepsilon \to 0^{+}} \int_{\Omega \cap \operatorname{supp} \varphi} \left| f' \circ u_{\varepsilon} - f' \circ u \| \partial_{i} u \| dx + L \| \varphi \|_{\mathcal{L}_{\infty}(\Omega)} \lim_{\varepsilon \to 0^{+}} \int_{\Omega \cap \operatorname{supp} \varphi} \left| \partial_{i} u_{\varepsilon} - \partial_{i} u \| dx \right| dx = \\
= \|\varphi\|_{\mathcal{L}_{\infty}(\Omega)} \lim_{\varepsilon \to 0^{+}} \int_{\Omega} \left| f' \circ u_{\varepsilon} - f' \circ u \| \partial_{i} u \| dx \right|,$$

where we have used $\nabla u_{\varepsilon} \to \nabla u$ in $L_1(\Omega \cap \operatorname{supp} \varphi)$. As for the second integral, recall that $u_{\varepsilon} \to u$ a.e. in $\Omega \cap \operatorname{supp} \varphi$ and that f' is globally continuous. Thus with the majorant

$$|f' \circ u_{\varepsilon} - f' \circ u||\partial_i u| \le L ||u||_{\mathbf{W}^{1,p}(\Omega)} |u_{\varepsilon} - u|,$$

that is integrable on the bounded set $\operatorname{supp} \varphi \cap \Omega$ we see the second integral is zero as well. All in all, we have shown

$$-\int_{\Omega} (f \circ u) \partial_{i} \varphi \, \mathrm{d}x = \int_{\Omega} (f' \circ u) \partial_{i} u \varphi \, \mathrm{d}x, \forall \varphi \in \mathcal{D} (\Omega),$$

which is exactly what we need to state that the ∂_i -weak derivative of $f \circ u$ exists and is equal to $(f' \circ u)\partial_i u$. Finally, the following estimate holds:

$$\left\| \underbrace{\nabla(f \circ u)}_{=\nabla(f \circ u - f(0))} \right\|_{L_{p}(\Omega)} = \left\| (f' \circ u) \nabla u \right\|_{L_{p}(\Omega)} \le L \|\nabla u\|_{L_{p}(\Omega)} \le L \|u\|_{W^{1,p}(\Omega)},$$

and so

$$f \circ u - f(0) \in W^{1,p}(\Omega)$$
.

Let us now deal with the first assertion. We will first show $\nabla u = 0$ a.e. on Ω_0 . For that, choose a special function

$$f(x) = \begin{cases} x, & x > 0, \\ 0, & x \le 0, \end{cases}$$

and so $f \circ u = u^+$. If we now set

$$f_{\varepsilon}(x) = \begin{cases} \left(x^2 + \varepsilon^2\right)^{1/2} - \varepsilon, & x > 0, \\ 0, & x \le 0, \end{cases}$$

with the derivative being

$$f'_{\varepsilon}(x) = \begin{cases} \frac{x}{(x^2 + \varepsilon^2)^{1/2}}, & x > 0, \\ 0, x \le 0 \end{cases}$$

and so $\lim_{\varepsilon \to 0^+} f_{\varepsilon}(x) = f(x)$, and $\lim_{\varepsilon \to 0^+} f'_{\varepsilon}(x) = \chi_{\mathbb{R}^+}(x)$ a.e. in \mathbb{R} , meaning

$$\lim_{\varepsilon \to 0^+} f_\varepsilon \circ u = u^+, \lim_{\varepsilon \to 0^+} f_\varepsilon' \circ u = \chi_{x \in \Omega \mid u(x) > 0},$$

a.e. in Ω . Using the preivously obtained general expression and passing to the limit yields

$$-\int_{\Omega} (f \circ u) \nabla \varphi \, \mathrm{d}x = \int_{\Omega} \nabla u \varphi \chi_{\{x \in \Omega \mid u(x) > 0\}} \, \mathrm{d}x,$$

and realizing²³ $u^- = (-u)^+$, we also have

$$-\int_{\Omega} (f \circ u) \nabla \varphi \, \mathrm{d}x = -\int_{\Omega} \nabla u \varphi \chi_{\{x \in \Omega \mid u(x) < 0\}} \, \mathrm{d}x,$$

meaning (in the weak sense)

$$\nabla u^+ = \nabla u \chi_{\{x \in \Omega \mid u(x) > 0\}}, \nabla u^- = -\nabla u \chi_{\{x \in \Omega \mid u(x) < 0\}}.$$

But since $u = u^+ - u^-$, it holds $\nabla u = \nabla u^+ - \nabla u^-$ a.e.. We see $\nabla u^- = \nabla u^+ = 0$, on Ω_0 , and so $\nabla u = 0$ on a.e. on Ω_0 . Taking $\tilde{u} = u + c$ for $c \in \mathbb{R}$ arbitrary, we see $\nabla \tilde{u} = \nabla u = 0$ a.e. on Ω_0 , meaning $\nabla \tilde{u} = 0$ a.e. on $\{x \in \Omega | \tilde{u} - c = 0\} = \Omega_c$. Since \tilde{u}, c were arbitrary, we are done with this proof.

If $u \notin S$, the above presentation works just fine. If $u(x) \in S$, we know $\nabla u = 0$ a.e. on Ω_u , and since $\lambda(S) = 0$ by Rademacher theorem, we have also the above conclusion. This argumentation is sloppy, but has not been presented in full detail.

²³Recall $u^+ = \max(0, u)$, $u^- = -\min(0, u)$ are both nonnegative functions, $u = u^+ - u^-$, $|u| = u^+ + u^-$. It holds trivially $u^- = -\min(0, u) = \max(0, -u) = (-u)^+$.

2.6.2 Difference quotients

There is some interplay between the weak derivative and difference quotients, which can be useful in some proofs, e.g., regularity results for elliptic problems. We have seen that if a function possesses classical derivatives, it also has weak derivatives and they conincide a.e.. Is something there something to be said about the opossite implication?

Definition 6 (Difference quotient). Let $u: \mathbb{R}^d \to \mathbb{R}, h \in \mathbb{R}$. For each $i \in \{1, \dots, d\}$ we define the difference quotient as

$$\Delta_h^i u(x) = \frac{u(x + he_i) - u(x)}{h},$$

where e_i is the canoncal base vector of \mathbb{R}^d .

Remark. If $\partial_i u(x)$ exists, then clearly

$$\partial_i u(x) = \lim_{h \to 0} \Delta_h^i u(x).$$

Let us jump straight to the main result.

Theorem 14. Let $\Omega \subset \mathbb{R}^d$ open, $p \in [1, \infty]$ and $u \in L_p(\Omega)$. Denote $\forall \delta > 0$ the set

$$\Omega_{\delta} = \{x \in \Omega | \operatorname{dist} (x, \partial \Omega) > \delta \}.$$

Then it holds

1. If moreover $u \in W^{1,p}(\Omega)$, then $\forall i \in \{1,\ldots,d\}, \delta \in (0,1), h \in (0,\frac{\delta}{2})$

$$\left\|\Delta_h^i u\right\|_{L_p(\Omega_\delta)} \le \left\|\partial_i u\right\|_{L_p(\Omega)}.$$

2. Let $p \in (1, \infty]$ and let there exist $\{C_i\}_{i=1}^d$ constants s.t. $\forall i \in \{1, \ldots, d\}, \delta \in (0, 1), h \in (0, \frac{\delta}{2})$ it holds

$$\|\Delta_h^i u\|_{L_2(\Omega_\delta)} \le C_i.$$

Then $u \in W^{1,p}(\Omega)$ and moreover $\forall i \in \{1,\ldots,d\}$ we have

$$\|\partial_i u\|_{L_n(\Omega)} \le C_i.$$

Proof. Ad 1. Let first $p \in [1, \infty)$. What else do we use to estimate differences then..., right? If needed, extend u by zero outside of Ω and set $u_{\varepsilon} = u \star \omega_{\varepsilon}$. Recall that $u_{\varepsilon} \to u$ in $W^{1,p}(\Omega_{\frac{\delta}{2}})$. Realize that since $u_{\varepsilon} \in C^{1}(\mathbb{R}^{d})$, we have

$$\Delta_h^i u_{\varepsilon}(x) = \frac{u_{\varepsilon}(x + he_i) - u_{\varepsilon}(x)}{h} = \frac{1}{h} \int_0^h \partial_t u_{\varepsilon}(x + te_i) dt.$$

Let us compute $\|\Delta_h^i\|_{L_p(\Omega_\delta)}$. We have

$$\left|\Delta_h^i u_{\varepsilon}\right|^p = \left|\frac{1}{h} \int_0^h \partial_t u_{\varepsilon}(x+te_i) dt\right|^p \le \frac{1}{h^p} \left(\int_0^h \left|\partial_t u_{\varepsilon}(x+te_i)\right| dt\right)^p \le \frac{1}{h^p} \left(\left(\int_0^h \left|\partial_t u_{\varepsilon}(x+te_i)\right|^p dt\right)^{\frac{1}{p}} \left(\int_0^h 1 dt\right)^{\frac{p-1}{p}}\right)^p = \frac{1}{h^p} \int_0^h \left|\partial_t u_{\varepsilon}(x+te_i)\right|^p dt h^{p-1} = \frac{1}{h} \int_0^h \left|\partial_t u_{\varepsilon}(x+te_i)\right|^p dt,$$

and so integrating over Ω_{δ} yields

$$\left\|\Delta_h^i u_{\varepsilon}\right\|_{\mathrm{L}_{p}(\Omega_{\delta})}^p \leq \frac{1}{h} \int_{\Omega_{\delta}} \int_0^h \left|\partial_t u_{\varepsilon}(x+te_i)\right|^p \mathrm{d}t \, \mathrm{d}x = \frac{1}{h} \int_0^h \int_{\Omega_{\delta}} \left|\partial_t u_{\varepsilon}(x+te_i)\right|^p \mathrm{d}x \, \mathrm{d}t,$$

denote $z = x + te_i$, then $z \in \Omega_{\delta} + te_i$, meaning the points have shifted towards Ω in one direction by at most $t \le h < \frac{\delta}{2}$. If we integrate over $\Omega_{\frac{\delta}{2}}$ instead, we make the domain larger and so

$$\left\|\Delta_h^i u_{\varepsilon}\right\|_{\mathrm{L}_p(\Omega_{\delta})}^p \leq \frac{1}{h} \int_0^h \int_{\Omega_{\frac{\delta}{2}}} \left|\partial_t u_{\varepsilon}(z)\right|^p \mathrm{d}z \, \mathrm{d}t \leq \frac{1}{h} h \|\partial_t u_{\varepsilon}\|_{\mathrm{L}_p\left(\Omega_{\frac{\delta}{2}}\right)}^p,$$

so if we pass to the limit $\varepsilon \to 0^+$ (we are in Ω_{δ}), we see

$$\left\|\Delta_h^i u\right\|_{\mathrm{L}_p(\Omega_\delta)} \leq \left\|\partial_t u\right\|_{\mathrm{L}_p\left(\Omega_{\frac{\delta}{2}}\right)} \leq \left\|\partial_t u\right\|_{\mathrm{L}_p(\Omega)}.$$

If now $p = \infty$, the things are not that simple - Ω is not bounded apriori, so we have no ordering of Lebesgue spaces. Let us fix that: take some R > 0 and denote $\Omega^R = \Omega \cap \mathrm{U}(0,R)$. If $u \in \mathrm{W}^{1,\infty}(\Omega)$, it must be $u \in \mathrm{W}^{1,p}(\Omega^R)$ for all $p \in [1,\infty)$. On Ω^R_δ we have from the above

$$\left\|\Delta_h^i u\right\|_{\mathbf{L}_{\mathbf{p}}(\Omega_{\mathbf{s}}^R)} \le \left\|\partial_t u\right\|_{\mathbf{L}_{\mathbf{p}}(\Omega^R)},$$

and since Ω_{δ}^{R} is bounded, we can pass to the limit $p \to \infty$ and write

$$\left\|\Delta_h^i u\right\|_{\mathcal{L}_{\infty}(\Omega_{\mathfrak{s}}^R)} \le \left\|\partial_t u\right\|_{\mathcal{L}_{\infty}(\Omega^R)},$$

and passing to the limit $R \to \infty$ we obtain

$$\|\Delta_h^i u\|_{\mathcal{L}_{\infty}(\Omega_{\delta})} \le \|\partial_t u\|_{\mathcal{L}_{\infty}(\Omega)}.$$

Ad 2. Once again extend u by zero outside of Ω and let for the moment $p \in (1, \infty)$. Fix $\{h_n\} \subset (0, \frac{\delta}{2})$ s.t. $h_n \to 0$ and consider the functions

$$v_n^i = \Delta_{h_n}^i u \chi_{\Omega_{2h_n}}.$$

Clearly (meaning from the assumptions)

$$\|v_n\|_{\mathbf{L}_{\mathbf{p}}(\Omega)}^i = \|\Delta_{h_n}^i u\|_{\mathbf{L}_{\mathbf{p}}(\Omega_{2h_n})} \le C_i,$$

and from the reflexivity of $L_p(\Omega)$, $p \in (1, \infty)$, we know $\exists v_i \in L_p(\Omega)$ such that

$$v_n^i \rightharpoonup v^i$$
,

as $n \to \infty$. Since the norm is weak lower semicontinuous, we also have the estimate

$$||v_i||_{\mathcal{L}_{\mathcal{P}}(\Omega)} \leq C_i.$$

It remains to show now that v_i are weak derivatives of u. Before we proceed, let us mention the following identity: let $\varphi \in \mathcal{D}(\Omega)$, then

$$\int_{\mathbb{R}^d} \Delta_h^i u \varphi \, \mathrm{d}x = \int_{\mathbb{R}^d} u \Delta_{-h}^i \varphi \, \mathrm{d}x.$$

Really, it holds THIS NEEDS TO BE FINISHED

$$\int_{\mathbb{R}^d} \Delta_h^i u \varphi \, \mathrm{d}x = \int_{\mathbb{R}^d} \frac{u(x + he_i) - u(x)}{h} \varphi \, \mathrm{d}x = \int_{\mathbb{R}^d} \frac{\varphi(x) u(x + he_i) - \varphi(x) u(x)}{h} \, \mathrm{d}x,$$

change the variables $y = x + he_i$, then the above integral is equal to

$$\int_{\mathbb{R}^d} \frac{\varphi(y - he_i)u(y) - \varphi(y - he_i)u(y - he_i)}{h} \, \mathrm{d}y =$$

Using this, we can obtain

$$\int_{\Omega} v_{i} \varphi \, dx = \lim_{n \to \infty} \int_{\Omega} v_{n}^{i} \varphi \, dx = \lim_{n \to \infty} \int_{\Omega_{2h_{n}}} \Delta_{h_{n}}^{i} u \varphi \, dx = \lim_{n \to \infty} \int_{\mathbb{R}^{d}} \Delta_{h_{n}}^{i} u \varphi \, dx =$$

$$= \lim_{n \to \infty} \int_{\mathbb{R}^{d}} u \Delta_{-h_{n}}^{i} \varphi \, dx = \lim_{n \to \infty} \int_{\mathbb{R}^{d}} u \frac{\varphi(x - h_{n}e_{i}) - \varphi(x)}{h_{n}} u(x) \, dx = -\int_{\mathbb{R}^{d}} u \partial_{i} \varphi \, dx =$$

$$= -\int_{\Omega} u \partial_{i} \varphi \, dx$$

which really means $v_i = \partial_i u$ in the weak sense. The fact we can integrate over \mathbb{R}^d instead of Ω_{2h_n} comes from the fact supp $\varphi \subset \Omega_{2h_n}$ for some n large enough, and since the whole integrand is zero on any larger set then Ω_{2h_n} , meaning we without a doubt expand the integration domain to the whole space; the interchange of differentiation and integration is simple, because φ has a compact support. All in all, we have shown $v_i = \partial_i u$ weakly and $\|v_i\|_{L_p(\Omega)} \leq C_i$, so we are done with the case $p \in (1, \infty)$.

If $p = \infty$, we can repeat the same arguments as in the above case: create a bounded domain $\Omega_R = \Omega \cap U(0, R)$, realize that

$$||v_i||_{\mathbf{L}_p(\Omega^R)} \le C_i, \forall p \in (1, \infty),$$

and then pass to the limits $R \to \infty, p \to \infty$.

Remark. We have thus shown that if $p \in (1, \infty)$, then

 $\Delta_h^i u \rightharpoonup \partial_i u, h \to 0^+$.

2.6.3 Representation of duals

The last stop within our adventure through Sobolev spaces will be the dual. We present a representation theorem for dual spaces of certain Sobolev spaces. The proof will use techniques developed later, in the chapter 4.

Theorem 15. Let $\Omega \in C^{0,1}$. Let $X = W_0^{1,r}(\Omega)$, $r \in (1, \infty)$ with equivalent norm $|||u||| = ||\nabla u||_{W_0^{1,r}(\Omega)}$. Then $\forall \Phi \in X^* \exists \mathbf{F} \in L_{r'}(\Omega)$ such that

$$\forall \varphi \in W_0^{1,r}(\Omega) : \Phi(\varphi) = \int_{\Omega} \mathbf{F} \cdot \nabla \varphi \, \mathrm{d}x,$$

and moreover it holds $\|\Phi\|_{X^*} = \|\mathbf{F}\|_{L_{r'}(\Omega)}$.

Proof. We solve the problem

$$\begin{cases}
-\nabla \cdot (|\nabla u|^{r-2} \nabla u) &= \Phi, \text{ in } \Omega, \\
u &= 0, \text{ on } \partial \Omega
\end{cases}$$
(2)

Let us check the solution exists: denote

$$a_0 = 0, \mathbf{a}(x, z, \mathbf{p}) = |\mathbf{p}|^{r-2} \mathbf{p}.$$

Then clearly

$$|a_i(x,z,\mathbf{p})| \le |\mathbf{p}|^{r-1},$$

so we have the right grow conditions, next:

$$\mathbf{a}(x,z,p) \cdot \mathbf{p} = |\mathbf{p}|^{r-2} \mathbf{p} \cdot \mathbf{p} = |\mathbf{p}|^r$$

so we have coercivity, and finally monotonicity; realize that actually ²⁴

$$\mathbf{a}(x,z,p) = \frac{1}{r} \nabla |\mathbf{p}|^r,$$

and for r > 1 is the function $\mathbf{p} \mapsto |\mathbf{p}|^r$ strictly convex. So from the classification of convex functions we know

 $\frac{1}{r}|\mathbf{p}|^r$ is strictly convex $\Leftrightarrow \nabla \frac{1}{r}|\mathbf{p}|^r = \mathbf{a}$ is strictly monotone.

By the existence & uniqueness theorem on problems with monotone operator, we conclude such $u \in W_0^{1,r}(\Omega)$ exists and is unique by. The weak formulation of the above problem is:

$$\forall \varphi \in W_0^{1,r}(\Omega): \int_{\Omega} |\nabla u|^{r-2} \nabla u \cdot \nabla \varphi \, \mathrm{d}x = \Phi(\varphi).$$

So it seems proimising to set $\mathbf{F} = |\nabla u|^{r-2} \nabla u$. If we test now the weak formulation with u itself (recall what norm are we using on X)

$$\|\nabla u\|_{\mathcal{L}_r(\Omega)}^r = \Phi(u) \le \|\Phi\|_{X^*} |\|u\|| = \|\Phi\|_{X^*} \|\nabla u\|_{\mathcal{L}_r(\Omega)}.$$

If now $\|\nabla u\|_{\mathbf{L}_r(\Omega)} = 0$, then $\Phi = 0$ and we are finished; if it is nonzero, then we can divide and write

$$\|\nabla u\|_{\mathcal{L}_r(\Omega)}^{r-1} \le \|\Phi\|_{X^*}.$$

Realize now

$$\|\nabla u\|_{\mathrm{L}_r(\Omega)}^{r-1} = \||\nabla u|^{r-1}\|_{\mathrm{L}_{\frac{r}{r-1}}(\Omega)} = \|\mathbf{F}\|_{\mathrm{L}_{r'}(\Omega)} \Rightarrow \|\mathbf{F}\|_{\mathrm{L}_{r'}(\Omega)} \leq \|\Phi\|_{X^*}.$$

On the other hand:

$$\|\Phi\|_{X^*} = \sup_{\mathrm{B}_X(0,1)} |\Phi(\varphi)| = \sup_{\mathrm{B}_X(0,1)} \left| \int_{\Omega} \mathbf{F} \cdot \nabla \varphi \, \mathrm{d}x \right| \leq \sup_{\mathrm{B}_X(0,1)} \|\mathbf{F}\|_{\mathrm{L}_{r'}(\Omega)} \|\nabla \varphi\|_{\mathrm{L}_r(\Omega)} = \|\mathbf{F}\|_{\mathrm{L}_{r'}(\Omega)},$$

which concludes
$$\|\Phi\|_{X^*} = \|\mathbf{F}\|_{\mathbf{L}_{r'}(\Omega)}$$
.

3 Nonlinear elliptic equations - compactness methods

So far we have dealt with only linear equations, *i.e.*, linear operators. When dealing with nonlinear operators, things get much more involved. This chapter will be dedicated to the study of nonlinear problems using compactness methods, which will especially allow us to solve problems with nonlinearities in the non-leading terms. Be especially careful about the assumptions on the operators - they do not need to be linear.

Let us start with some technical, mostly known lemmas.

3.1 Nemytskii operators

Lemma 9 (Fatou). Let $\Omega \subset \mathbb{R}^d$ be measurable, let $\{f_n\}$ be a sequence of measurable nonnegative functions. Then it holds

$$\int_{\Omega} \liminf_{n \to \infty} f_n \, \mathrm{d}x \le \liminf_{n \to \infty} \int_{\Omega} f_n \, \mathrm{d}x.$$

(Both integrals can be infinity.)

Theorem 16 (Iegorov). Let $\Omega \subset \mathbb{R}^d$ be measurable and of finite Lebesgue measure, let $\{f_n\}$ and f be measurable and finite a.e. in Ω . Then the following statements are equivalent

- 1. $f_n(x) \to f(x), \forall a.a. x \in \Omega$,
- 2. $\forall \varepsilon > 0 \exists G \subset \Omega \text{ open s.t. } \lambda(G) < \varepsilon \text{ and } f_n \Rightarrow f \text{ on } \Omega/G.$

Theorem 17 (Vitali). Let $\Omega \subset \mathbb{R}^d$ be measurable and of finite Lebesgue measure, let $\{f_n\}$ and f be measurable s.t. $f_n(x) \to f(x)$ for a.a. $x \in \Omega$. Let moreover be true

$$\forall \varepsilon > 0 \exists \delta > 0 : \forall n \in \mathbb{N}, \forall H \subset \Omega \text{ s.t. } \lambda(H) < \delta \Rightarrow \int_{H} |f_{n}| \, \mathrm{d}x \leq \varepsilon.$$

Then

$$\lim_{n \to \infty} \int_{\Omega} f_n \, \mathrm{d}x = \int_{\Omega} f \, \mathrm{d}x.$$

Remark (What is $f(\cdot, x)$?). In the following definitions and throughout the chapter in general, we use the " \cdot " to denote variables in the following sense. Just to make it clear, this means the following. If U, V, W are some sets and $f: U \times V \to W$, we write

- $f(u, \cdot): V \to W$, as the mapping $V \ni v \mapsto f(u, v) \in W$ for some $u \in U$ fixed,
- $f(\cdot, v): U \to W$, as the mapping $U \ni u \mapsto f(u, v) \in W$ for some $v \in V$ fixed.

Definition 7 (Caratheodory function). Let $\Omega \subset \mathbb{R}^d$ be measurable, $N \in \mathbb{N}$. We say the function $f: \Omega \times \mathbb{R}^N \to \mathbb{R}$ is Caratheodory if

- 1. $f(x, \cdot): \mathbb{R}^N \to \mathbb{R}$ is continuous for almost all $x \in \Omega$,
- 2. $f(\cdot, y): \Omega \to \mathbb{R}$ is measurable for all $y \in \mathbb{R}^N$.

Definition 8 (Nemytskii operator). Let $\Omega \subset \mathbb{R}^d$ be measurable, $N \in \mathbb{N}$ and $f : \Omega \times \mathbb{R}^N \to \mathbb{R}$ be Caratheodory. For $\mathbf{u} : \Omega \to \mathbb{R}^N$, $x \in \Omega$ we define the Nemytskii operator N_f : as

$$N_f: \mathbf{u}(x) \mapsto f(x, \mathbf{u}(x)),$$

meaning N_f is an operator between function spaces, whose image is the function $N_f \mathbf{u}: \Omega \to \mathbb{R}$ s.t.

$$N_f \mathbf{u}(x) = f(x, \mathbf{u}(x)), x \in \Omega.$$

Remark. We write **u** in bold to stress $u: \Omega \to \mathbb{R}^N$ is a vector valued mapping, even though we might drop the notation later on.

Remark. This definition is similar to the one used in the Caratheodory theory of ordinary differential equations, but not the same.

Theorem 18 (On Nemytskii operators). Let $\Omega \subset \mathbb{R}^d$ be measurable, $N \in \mathbb{N}, f : \Omega \times \mathbb{R}^N \to \mathbb{R}$ be Caratheodory. Then

- 1. if $\mathbf{u}: \Omega \to \mathbb{R}^N$ is measurable, then $N_f \mathbf{u}: \Omega \to \mathbb{R}$ is also measurable,
- 2. if there are numbers $p_i \in [1, \infty), i \in \{1, \dots, N\}$, an exponent $p \in [1, \infty)$, a function $g \ s.t. \ g \in L_p(\Omega)$, and a constant $C \ge 0$ such that for almost all $x \in \Omega$ and all $y \in \mathbb{R}^N$ it holds

$$|f(x,y)| \le g(x) + C \sum_{i=1}^{N} |y_i|^{\frac{p_i}{p}},$$

then the Nemytskii operator $N_f : \mathbf{u} \mapsto N_f \mathbf{u}$ is continuous from $L_{p_1}(\Omega) \times L_{p_2}(\Omega) \times \dots L_{p_N}(\Omega)$ to $L_p(\Omega)$ and moreover it maps sets bounded in $L_{p_1}(\Omega) \times L_{p_2}(\Omega) \times \dots L_{p_N}(\Omega)$ to sets bounded in $L_p(\Omega)$. We write

$$N_f \in \mathcal{C}(L_{p_1}(\Omega), \ldots, L_{p_N}(\Omega); L_p(\Omega)).$$

Proof. No proof \Box

Remark. The information about boundedness of images of bounded sets is not trivial - the Nemytskii operator is not linear in general.

3.2 Fixed point theorems

The majority of the problems we will be dealing with will be solved by using some fixed points theorem. Here we state two of them (without proofs).

Definition 9 (Compact operator). Let X,Y be normed linear spaces, $M \subset X$. The mapping $F: M \to Y$ is called a compact operator on M into Y provided

- 1. F is continuous,
- 2. $F(M \cap K) \subset Y$ is relatively compact in Y for any bounded $K \subset X$.

Remark. • We have no linearity of F! So continuity cannot follow from compactness and we have to assume it explicitly. In general, compactness \Rightarrow boundedness \neq continuity for nonlinear operators.

- one might wonder why just not state $F(K) \subset Y$ is relatively compact in Y for $K \subset M$ bounded. First of all, this is pretty much the same, but in the applications, this formulation will be more suitable for us. Secondly, in general M need not be a subspace of X, let alone a normed linear space; in such cases the notion of boundedness of $K \subset M$ is not defined at all. On the other hand, boundedness of $K \subset X$ can be measured in the metric of X.
- The definition is from Drábek, Milota: Methods of Nonlinear Analysis, Def 5.2.2

Theorem 19 (Brouwer fixed point theorem). Let $N \in \mathbb{N}$ and $K \subset \mathbb{R}^N$, be a nonempty convex closed bounded subset of \mathbb{R}^N . Assume further that $F: K \to K$ is continuous. Then F has a fixed point in K, i.e.,

$$\exists x_0 \in K : F(x_0) = x_0.$$

Proof. No proof.

Theorem 20 (Schauder fixed point theorem). Let X be a linear normed space and $K \subset X$ be a nonempty convex closed bonded subset of X. Assume further that $F: K \to K$ is compact on K into K and $F(K) \subset K$. Then there is fixed point of F in K, i.e.,

$$\exists x_0 \in K : F(x_0) = x_0.$$

Proof. No proof. \Box

Remark. • for Brouwer, $K \subset \mathbb{R}^N$ so since it is closed and bouded, it is automatically compact, and since $F: K \to K$ is continuous, F is compact²⁵. For Schauder, we have to assume this extra.

- realize again that in Schauder, the set K does not have to be a subspace of X.
- proof of Brouwer with N=1 is easy, based on Darboux property.

3.3 Problem protypes

In this chapter some nonlinear elliptic equations are discussed. The strategy of solving them (i.e., proving a solution exists) will be always the same - define a suitable operator and show it has a fixed point.

Example. Suppose the following problem:

$$\begin{cases} -\triangle u + g(u) = f & \text{in } \Omega \\ u = 0 & \text{on } \partial \Omega, \end{cases}$$

where $f \in \left(\mathbf{W}_0^{1,2}(\Omega)\right)^*, g : \mathbb{R} \to \mathbb{R}$ is continuous and has a controlled grow $s.t. \ \exists C > 0, \exists \alpha \in (0,1]$:

$$\forall s \in \mathbb{R} : |g(s)| \le C(1+|s|^{\alpha}).$$

Even though g might be nonlinear, we assume only (sub)linear growth of it - so this is kind of cheating.

²⁵Image of a compact set under continuous mapping is a compact set

Theorem 21 (Existence). Let $\Omega \in C^{1,1}$, $f \in (W_0^{1,2}(\Omega))^*$, g is as above. Then there is a weak solution to the above problem, i.e., it holds:

$$\forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi + g(u) \varphi \, \mathrm{d}x = \langle f, \varphi \rangle_{(W_0^{1,2}(\Omega))^*}.$$

If $f \in L_2(\Omega)$, then the solution $u \in W^{2,2}(\Omega)$.

Proof. We define $S: L_2(\Omega) \to L_2(\Omega)$ such that ²⁶

$$Sw = u \Leftrightarrow \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi \, \mathrm{d}x = \langle f, \varphi \rangle - \int_{\Omega} g(w) \varphi \, \mathrm{d}x.$$

Clearly, when Sw = w, i.e., S has a fixed point and then

$$Sw = w \Leftrightarrow \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla w \cdot \nabla \varphi \, \mathrm{d}x = \langle f, \varphi \rangle - \int_{\Omega} g(w) \varphi \, \mathrm{d}x,$$

and so the solution w to our problem exists. S is defined in an implicit way, but it might be guiding to think of it, written in strong formulation, as

$$Sw = -(\triangle)^{-1}(f - g(w),$$

meaning Sw is the solution u to (modulo boundary conditions)

$$- \triangle u = f - g(w),$$

also meaning Sw is the solution u to the Poisson equation with the RHS "build from w." First, let us show S is well defined:

$$\left| \int_{\Omega} g(w) \varphi \, \mathrm{d}x + \langle f, \varphi \rangle \right| \leq \|f\|_{(W_0^{1,2}(\Omega))^*} \|\varphi\|_{W^{1,2}(\Omega)} + \|\varphi\|_{L_2(\Omega)} \|g(w)\|_{L_2(\Omega)},$$

and

$$\int_{\Omega} |g(w)|^2 dx \le \int_{\Omega} C^2 (1+|w|^{\alpha})^2 dx \le \int_{\Omega} 2C^2 (1+|w|^{2\alpha}) dx \le \int_{\Omega} 2C^2 (1+|w|^2) dx < \infty,$$

where we used the Young inequality²⁷, $\alpha \le 1$ and the fact S is defined on $L_2(\Omega)$, meaning $w \in L_2(\Omega)$. With that information, we see the last integral is finite and so truly $S : L_2(\Omega) \to L_2(\Omega)$ is well defined

Also, the estimate $|g(w)| \le C(1 + |w|^{\alpha})$, $\alpha \in (0,1]$ together with the fact $C(1 + w^{\alpha}) \in L_2(\Omega)$ for $w \in L_2(\Omega)$ means the Nemytskii operator

$$w \mapsto g(w) \in \mathcal{C}(L_2(\Omega); L_2(\Omega)),$$

is continuous from $L_2(\Omega)$ to $L_2(\Omega)$.

Let us now show that S is continuous as a whole. Define $I_g \in (W_0^{1,2}(\Omega))^*$ as

$$I_g(\varphi) = \int_{\Omega} g(w)\varphi \, \mathrm{d}x - \langle f, \varphi \rangle.$$

²⁶Meaning the image Sw of w is the function u such that the integral equality holds. We could also assume $S: L_2(\Omega) \to W^{1,2}(\Omega)$, but for compactness we need the origin and target spaces to be the same.

 $^{^{27}}$ In the form $(a+b)^2 \le 2(a^2+b^2)$.

We are interested in the continuity of the (nonlinear!) mapping $g \mapsto I_g$ as a mapping from $L_2(\Omega)$ to $(W_0^{1,2}(\Omega))^*$. Let $\{g_k\} \subset L_2(\Omega)$ be a sequence s.t. $g_k \to g$ in $L_2(\Omega)$. Then

$$||I_{g_{k}} - I_{g}||_{\left(W_{0}^{1,2}(\Omega)\right)^{*}} = \sup_{\varphi \in U_{W_{0}^{1,2}(\Omega)}(0,1)} |(I_{g_{k}} - I_{g})(\varphi)| = \sup_{U_{W_{0}^{1,2}(\Omega)}(0,1)} \left| \left(\int_{\Omega} g_{k} \varphi \, dx - \langle f, \varphi \rangle - \int_{\Omega} g \varphi \, dx + \langle f, \varphi \rangle \right) \right| \leq \sup_{U_{W_{0}^{1,2}(\Omega)}(0,1)} \int_{\Omega} |g - g_{k}| ||\varphi| \, dx \leq ||g - g_{k}||_{L_{2}(\Omega)} \to 0,$$

so we have shown $g \to g_k$ in $L_2(\Omega) \Rightarrow I_g \to I_{g_k}$ in $\left(W_0^{1,2}(\Omega)\right)^*$, and so $(g \mapsto I_g) \in \mathcal{C}\left(L_2(\Omega); \left(W_0^{1,2}(\Omega)\right)^*\right)$. Finally, define the operator $L: \left(W_0^{1,2}(\Omega)\right)^* \to W_0^{1,2}(\Omega)$, as

$$Lh = u \Leftrightarrow \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi \, \mathrm{d}x = \langle h, \varphi \rangle,$$

or in other words, L maps $h \mapsto u$, where u solves

$$\begin{cases} -\triangle u = h, & \text{in } \Omega, \\ u = 0, & \text{on } \partial \Omega \end{cases}.$$

or in other other, informal, words

$$Lh = -(\triangle)^{-1}h.$$

Realize that this approach been studied in the chapter about Fredholm theory extensively. In this simple case however, recall the apriori estimates that the solution satisfies (that is guaranteed from the properties of the Poisson equation)

$$||u||_{W_0^{1,2}(\Omega)} \le C||h||_{(W_0^{1,2}(\Omega))^*},$$

which together with the linearity of L checks $h \mapsto u$ is continuous. Putting it all together:

- $(w \mapsto g(w)) \in \mathcal{C}(L_2(\Omega); L_2(\Omega)),$
- $(g(w) \mapsto f g(w)) \in \mathcal{C}\left(L_2(\Omega); \left(W_0^{1,2}(\Omega)\right)^*\right), ^{28}$
- $(f g(w) \mapsto u) \in \mathcal{C}\left(\left(W_0^{1,2}(\Omega)\right)^*; W_0^{1,2}(\Omega)\right)$

In total, the composition is continuous and yields S.

Next, we would like to show S is a compact (nonlinear) operator. We start with showing S maps bounded sets in $L_2(\Omega)$ to bounded sets in $W_0^{1,2}(\Omega) \hookrightarrow L_2(\Omega)$; for that we need apriori estimates: test the weak formulation with u: (we are doing this a bit more careful that might seem needed,

²⁸In the sense we interpret the RHS as a point in the dual space. Precisely, we should write something like $(g(w) \mapsto (\varphi \in W_0^{1,2}(\Omega) \mapsto \langle f, \varphi \rangle - \int_{\Omega} g(w) \varphi dx)) \in \mathcal{C}(L_2(\Omega); (W_0^{1,2}(\Omega))^*).$

but come on, it is the first example...)

$$\begin{split} \underbrace{\|\nabla u\|_{\mathrm{L}_{2}(\Omega)}^{2}}_{C_{p}^{2}\|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)}^{2}} &\leq \|f\|_{\left(\mathrm{W}_{0}^{1,2}(\Omega)\right)^{*}} \|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)} + \|g(w)\|_{\mathrm{L}_{2}(\Omega)} \|u\|_{\mathrm{L}_{2}(\Omega)} \leq \\ &\leq \frac{\|f\|_{\left(\mathrm{W}_{0}^{1,2}(\Omega)\right)^{*}}}{\sqrt{2\varepsilon_{1}}} \sqrt{2\varepsilon_{1}} \|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)} + \frac{\|g(w)\|_{\mathrm{L}_{2}(\Omega)}}{\sqrt{2\varepsilon_{2}}} \sqrt{2\varepsilon_{2}} \|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)} \leq \\ &\leq (\varepsilon_{1} + \varepsilon_{2}) \|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)}^{2} + \frac{1}{4\varepsilon_{1}} \|f\|_{\left(\mathrm{W}_{0}^{1,2}(\Omega)\right)^{*}}^{2} + \frac{1}{4\varepsilon_{2}} \|g(w)\|_{\mathrm{L}_{2}(\Omega)}^{2} \leq \\ &\leq (\varepsilon_{1} + \varepsilon_{2}) \|u\|_{\mathrm{W}_{0}^{1,2}(\Omega)}^{2} + \frac{1}{4\min\left(\varepsilon_{1}, \varepsilon_{2}\right)} \Big(\|f\|_{\left(\mathrm{W}_{0}^{1,2}(\Omega)\right)^{*}}^{2} + \|g(w)\|_{\mathrm{L}_{2}(\Omega)}^{2} \Big), \end{split}$$

and since $\|g(w)\|_{L_2(\Omega)}^2 \le \|C(1+|w|^{\alpha})\|_{L_2(\Omega)}^2 \le 4C^2((\lambda(\Omega))^2 + \|w\|_{L_2(\Omega)}^2)$ and Poincare inequality, we can write

$$||u||_{\mathbf{W}_{0}^{1,2}(\Omega)}^{2} \leq \frac{1}{4(C_{p}^{2} - (\varepsilon_{1} + \varepsilon_{2})) \min(\varepsilon_{1}, \varepsilon_{2})} (||f||_{(\mathbf{W}_{0}^{1,2}(\Omega))^{*}}^{2} + 4(\lambda(\Omega))^{2} + ||w||_{\mathbf{L}_{2}(\Omega)}^{2})),$$

which, for $\varepsilon_1, \varepsilon_2$ sufficiently small, just an estimate of the type

$$||u||_{\mathbf{W}_{0}^{1,2}(\Omega)}^{2} \le C(1 + ||f||_{(\mathbf{W}_{0}^{1,2}(\Omega))^{*}}^{2} + ||w||_{\mathbf{L}_{2}(\Omega)}^{2}).$$

As we can see, if $w \in L_2(\Omega)$ is bounded, also $u \in W_0^{1,2}(\Omega)$ is bounded, so S maps bounded sets from $L_2(\Omega)$ to bounded sets in $W_0^{1,2}(\Omega)$. Since moreover $W_0^{1,2}(\Omega) \hookrightarrow L_2(\Omega)$, this means S is compact from $L_2(\Omega)$ to $L_2(\Omega)$.

To conclude the proof, we need that there exists $K \subset L_2(\Omega)$ closed convex bounded nonempty s.t. $S(K) \subset K$, so we can use Schauder. That clearly will be the case when we show $S(B_{L_2(\Omega)}(0,R)) \subset K$ $B_{L_2(\Omega)}(0,R)$ for some R>0. But this is simple - the estimate

$$||u||_{\mathrm{L}_{2}(\Omega)}^{2} \leq ||u||_{\mathrm{W}_{0}^{1,2}(\Omega)}^{2} \leq C \left(\underbrace{1 + ||f||_{(\mathrm{W}_{0}^{1,2}(\Omega))^{*}}^{2} + ||w||_{\mathrm{L}_{2}(\Omega)}^{2}}_{:=C_{1}}\right),$$

tells us if the R were to exist, it must hold

$$R^2 \le CC_1 + CR^2 \Leftrightarrow R^2(1-C) \le CC_1$$
.

If 1-C>0, then just take $R \le \sqrt{\frac{CC_1}{1-C}}$, if 1-C<0, any R>0 will do. And so we see such an R exists in all cases \Rightarrow the image of a ball is in a ball for some $R\Rightarrow S$ is compact on $B_{L_2(\Omega)}(0,R)$ into $B_{L_2(\Omega)}(0,R) \Rightarrow$ it has a fixed point by Schauder \Leftrightarrow the solution exists.

For the regularity part of the assertion, realize that u_0 solves

$$\begin{cases} -\triangle u_0 = f - g(u_0), & \text{in } \Omega \\ u_0 = 0, & \text{on } \partial\Omega. \end{cases}$$

and if $f \in L_2(\Omega)$, then $f - g(u_0) \in L_2(\Omega)$ and so from the regularity theory for elliptic equations we get

$$u \in W^{2,2}(\Omega)$$
.

Theorem 22 (Uniqueness). Let $u_1, u_2 \in W_0^{1,2}(\Omega)$ be weak solutions to the above problem. Let $f \in (W_0^{1,2}(\Omega))^*$ and let g be continuous. Let either extra

1. g is nondecreasing, or

2.
$$g \in C^1(\mathbb{R}), \|g'\|_{L_{\infty}(\mathbb{R})}$$
 small.

Then $u_1 = u_2$.

Proof. In the linear case, $u_1 - u_2$ would be a solution to the problem with zero data. In the nonlinear case, we have now certainity $u_1 - u_2$ solves anything, so we will have to be more careful.

Subtract the equations for u_1, u_2 and test the weak formulation with $u_1 - u_2$.:

$$\int_{\Omega} |\nabla (u_1 - u_2)|^2 + (g(u_1) - g(u_2))(u_1 - u_2) \, \mathrm{d}x = 0.$$

In the first case, the second term is nonnegative, so for the whole thing to be zero it has to hold

$$0 = \left\| \nabla (u_1 - u_2) \right\|_{\mathbf{L}_2(\Omega)}^2 \ge C_p \left\| u_1 - u_2 \right\|_{\mathbf{W}^{1,2}(\Omega)}^2 \Rightarrow u_1 - u_2 = 0 \in \mathbf{W}_0^{1,2}(\Omega) \,.$$

In the second case, the second does not have a sign, but we can estimate it

$$\left| \int_{\Omega} (g(u_1) - g(u_2)(u_1 - u_2)) \, \mathrm{d}x \right| \leq \int_{\Omega} \|g'\|_{\mathrm{L}_{\infty}(\mathbb{R})} |u_1 - u_2|^2 |\, \mathrm{d}x \leq \|g'\|_{\mathrm{L}_{\infty}(\mathbb{R})} C_p \|\nabla(u_1 - u_2)\|_{\mathrm{L}_{2}(\Omega)}^2,$$

meaning

$$\|\nabla(u_1 - u_2)\|_{\mathcal{L}_2(\Omega)}^2 \pm \|g\|_{\mathcal{L}_{\infty}(\mathbb{R})} C_p \|\nabla(u_1 - u_2)\|_{\mathcal{L}_2(\Omega)}^2 = (1 \pm \|g\|_{\mathcal{L}_{\infty}(\mathbb{R})} C_p) \|\nabla(u_1 - u_2)\|_{\mathcal{L}_2(\Omega)}^2 \le 0.$$

If the term is positive we again obtain $u_1 = u_2$ in $W_0^{1,2}(\Omega)$ from the Poincare inequality, if it is negative, we require

$$\|g'\|_{\mathcal{L}_{\infty}(\mathbb{R})}C_p < 1,$$

and then we have the same result.

Example. Suppose the following problem

$$\begin{cases} -\triangle u + b(\nabla u) = f, & \text{in } \Omega \\ u = 0, & \text{on } \partial \Omega. \end{cases}$$

where $f \in (W_0^{1,2}(\Omega))^*$, and the function $b : \mathbb{R}^d \to \mathbb{R}$ is continuous and (essentialy) bounded. The weak formulation is:

$$\operatorname{find} u \in W_0^{1,2}(\Omega) \ s.t. : \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi + b(\nabla u) \varphi \, \mathrm{d}x = \langle f, \varphi \rangle_{(W_0^{1,2}(\Omega))^*},$$

Theorem 23. Let $f \in (W_0^{1,2}(\Omega))^*$, $\Omega \in C^{0,1}$, $b : \mathbb{R}^d \to \mathbb{R}$ continuous and essentially bounded. Then there is a weak solution to the above problem.

Proof. As in the previous: define the operator $S: \mathrm{W}^{1,2}_0(\Omega) \to \mathrm{W}^{1,2}_0(\Omega)$, such as

$$Sw = u \Leftrightarrow \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi \, dx = \langle f, \varphi \rangle - \int_{\Omega} b(\nabla w) \varphi \, dx,$$

or equivalently

$$Sw = u \Leftrightarrow u \text{ is the solution to } \begin{cases} - \triangle u = f - b(\nabla w) & \text{in } \Omega \\ u = 0 & \text{on } \partial \Omega. \end{cases}$$

or informally

$$Sw = -(\triangle)^{-1}(f - b(\nabla w)),$$

modulo boundary conditions. Once again, if we are able to show S has a fixed point, this information is equivalent to the considered problem having a solution.

Let us first show S is well defined. Holder yields

$$\|\nabla u\|_{L_{2}(\Omega)} \|\nabla \varphi\|_{L_{2}(\Omega)} \leq \|f\|_{(W_{0}^{1,2}(\Omega))^{*}} \|\varphi\|_{W_{0}^{1,2}(\Omega)} + \|b\|_{L_{\infty}(\mathbb{R}^{d})} \|\varphi\|_{L_{1}(\Omega)},$$

use Poincare inequality and $W_0^{1,2}(\Omega) \to L_1(\Omega)$, to obtain

$$||u||_{W_0^{1,2}(\Omega)} \le \underbrace{C(||f||_{(W_0^{1,2}(\Omega))^*} + ||b||_{L_{\infty}(\mathbb{R}^d)})}_{:=R},$$

and so we see that the target space really is $W_0^{1,2}(\Omega)$. Also, the above estimate is extra nice, as it does not depend on w whatsoever. If we denote the RHS by R > 0, we immediately see $\begin{aligned} \|u\|_{\mathbf{W}_{0}^{1,2}(\Omega)} &= \|Sw\|_{\mathbf{W}_{0}^{1,2}(\Omega)} \leq R, \text{ meaning that for sure } S\Big(\mathbf{B}_{\mathbf{W}_{0}^{1,2}(\Omega)}(0,R)\Big) \subset \mathbf{B}_{\mathbf{W}_{0}^{1,2}(\Omega)}(0,R). \text{ Let us show other properties needed for compactness.} \\ &\text{First, } \nabla \colon \mathbf{W}_{0}^{1,2}(\Omega) \to \mathbf{L}_{2}\big(\Omega; \mathbb{R}^{d}\big), w \mapsto \nabla w \text{ is linear and bounded,} \end{aligned}$

$$\|\nabla w\|_{\mathcal{L}_2(\Omega)} \le \|w\|_{\mathcal{W}_0^{1,2}(\Omega)},$$

and so continuous, the map $\mathbf{y} \mapsto b(\mathbf{y})$ satisfies the growth

$$|b(\mathbf{y})| \leq \underbrace{\|b\|_{\mathcal{L}_{\infty}(\mathbb{R}^d)}}_{\text{"=} q(x)\text{"}} + 0 \cdot \sum_{i=1}^d |y_i|^{2/2},$$

and since $\lambda(\Omega) < \infty$, we have (in particular) $||b||_{L_{\infty}(\mathbb{R}^d)} \in L_2(\Omega)$. Putting this together means $N_b: \nabla w \mapsto b(\nabla w)$ is continuous from $^{29} L_2(\Omega; \mathbb{R}^d)$ to $L_2(\Omega; \mathbb{R})$

$$(\nabla w \mapsto b(\nabla w)) \in \mathcal{C}(L_2(\Omega; \mathbb{R}^d); L_2(\Omega; \mathbb{R}))$$

²⁹We should be more precise and write it is continuous from $L_2(\Omega; \mathbb{R}^d)$ to $L_2(\Omega; \mathbb{R})$, as $b: \mathbb{R}^d \to \mathbb{R}$.

by Nemytskii. Next, the mapping

$$b(\nabla w) \mapsto b(\nabla w) + f$$

from $L_2(\Omega)$ to $(W_0^{1,2}(\Omega))^*$ in the sense

$$b(\nabla w) \mapsto \left(W_0^{1,2}(\Omega) \ni \varphi \mapsto \langle f, \varphi \rangle_{\left(W_0^{1,2}(\Omega)\right)^*} + \int_{\Omega} b(\nabla w) \varphi \, \mathrm{d}x \right)$$

is also continous: let $\{b_k\} \subset L_2(\Omega)$ s.t. $b_k \to b$, in $L_2(\Omega)$, then

$$\sup_{\mathbf{U}_{\mathbf{W}_{0}^{1,2}(\Omega)}(0,1)} \left| \langle f, \varphi \rangle - \int_{\Omega} b_{k}(\nabla)\varphi \, \mathrm{d}x - \langle f, \varphi \rangle + \int_{\Omega} b(\nabla w)\varphi \, \mathrm{d}x \right| \leq \sup_{\mathbf{U}_{\mathbf{W}_{0}^{1,2}(\Omega)}(0,1)} \int_{\Omega} \left| b(\nabla w) - b_{k}(\nabla w) \right| |\varphi| \, \mathrm{d}x \leq \left\| b_{k} - b \right\|_{\mathbf{L}_{2}(\Omega)} \to 0,$$

and so the mapping $b(\nabla w) \mapsto b(\nabla w) + f$ is continuous from $L_2(\Omega)$ to $L_2(\Omega)$. Finally, the mapping $L: (W_0^{1,2}(\Omega))^* \to W_0^{1,2}(\Omega)$,

$$Lh = u \Leftrightarrow \forall \varphi \in W_0^{1,2}(\Omega) : \int_{\Omega} \nabla u \cdot \nabla \varphi \, dx = \langle h, \varphi \rangle,$$

i.e.,

$$Lh = u \Leftrightarrow u \text{ solves } \begin{cases} -\bigtriangleup u = h, & \text{in } \Omega, \\ u = 0, & \text{on } \partial \Omega, \end{cases}$$

is also continuous between the spaces - it is just again the solution operator to the Poisson equation with a RHS $h \in (W_0^{1,2}(\Omega))^*$. Altogether

- $(w \mapsto \nabla w) \in \mathcal{C}(W_0^{1,2}(\Omega); L_2(\Omega; \mathbb{R}^d))$
- $(\nabla w \mapsto b(\nabla w)) \in \mathcal{C}(L_2(\Omega; \mathbb{R}^d); L_2(\Omega; \mathbb{R})),$
- $(b(\nabla w) \mapsto f b(\nabla w)) \in \mathcal{C}(L_2(\Omega); (W_0^{1,2}(\Omega))^*),$
- $(f b(\nabla w) \mapsto u) \in \mathcal{C}((W_0^{1,2}(\Omega))^*; W_0^{1,2}(\Omega)),$

and so S as a composition of those mappings is continuous from $W_0^{1,2}(\Omega)$ to $W_0^{1,2}(\Omega)$. It remains to show S is compact: we already have continuity, consider now $\{w_k\}_{k\in\mathbb{N}}\subset W_0^{1,2}(\Omega)$ bounded. Then, by the compact embedding $W_0^{1,2}(\Omega)\hookrightarrow L_1(\Omega)$, there $\exists \{u_k\}\subset \{w_k\}\subset W_0^{1,2}(\Omega)$ (also bounded) s.t. $u_k\to u$ in $L_1(\Omega)$. To conclude, use the following trick (as when showing uniqueness to the previous problem): subtract equation for u_k from equation for u_l and test with u_l-u_k

$$\int_{\Omega} \nabla u_{l} \cdot \nabla (u_{l} - u_{k}) \, \mathrm{d}x + \int_{\Omega} b(\nabla u_{l})(u_{l} - u_{k}) \, \mathrm{d}x - \langle f, u_{l} - u_{k} \rangle - \left(\int_{\Omega} \nabla u_{k} \cdot \nabla (u_{l} - u_{k}) \, \mathrm{d}x + \int_{\Omega} b(\nabla u_{k})(u_{l} - u_{k}) \, \mathrm{d}x - \langle f, u_{l} - u_{k} \rangle \right),$$

meaning

$$C\|u_{l}-u_{k}\|_{\mathbf{W}_{0}^{1,2}(\Omega)}^{2} \leq \|\nabla(u_{l}-u_{k})\|_{\mathbf{L}_{2}(\Omega)}^{2} \leq \int_{\Omega} |b(\nabla u_{l})-b(\nabla u_{k})| \|u_{l}-u_{k}\|_{\mathbf{d}x} \leq 2\|b\|_{\mathbf{L}_{\infty}(\Omega)} \|u_{l}-u_{k}\|_{\mathbf{L}_{1}(\Omega)},$$

$$\|u_l - u_k\|_{\mathbf{W}_0^{1,2}(\Omega)}^2 \le C \|u_l - u_k\|_{\mathbf{L}_q(\Omega)}.$$

And we are finished - the sequence $\{u_n\}$ converges in $L_1(\Omega)$, so is Cauchy in $L_1(\Omega)$, and the above inequality proves that also $\{u_n\}$ is Cauchy in a complete space $W_0^{1,2}(\Omega)$, meaning $\{u_n\}$ converges in $W_0^{1,2}(\Omega)$. All in all, $\{u_n\} \subset W_0^{1,2}(\Omega)$ is a convergent subsequence of a bounded sequence $\{w_k\} \subset W_0^{1,2}(\Omega)$, meaning S is compact on $B_{W_0^{1,2}(\Omega)}(0,R)$ into $B_{W_0^{1,2}(\Omega)}(0,R)$ and so must possess a fixed point by the Schauder fixed point theorem.

4 Nonlinear elliptic equations - monotone operator theory

The method of compact perturbations allowed us to solve some nonlinear problems. This relied on the fact that nonlinearities were present mainly in the nonleading terms and so we were able to use our theory we developed for linear equations (continuity of the solution operators, regularity results, etc.) In this chapter we examine a different approach that will allow us to solve a particular class of problems even with nonlinearities in the leading term.

Consider the following problem:

$$-\sum_{i=1}^{d} \partial_i (a_i(x, u(x), \nabla u(x))) + a_0(x, u(x), \nabla u(x)) = f(x), \text{ in } \Omega$$

or written more concisely

$$-\nabla \cdot (\mathbf{a}(x, u(x), \nabla u(x))) + a_0(x, u(x), \nabla u(x)) = f(x), \text{ in } \Omega,$$

$$u = u_0, \text{ on } \Omega,$$
(3)

where $\mathbf{a}: \Omega \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}^d$.

$$\mathbf{a}(x, u(x), \nabla u(x)) = (a_1(x, u(x), \nabla u(x)), \dots, a_d(x, u(x), \nabla u(x))),$$

is some *nonlinear* vector function. The data of the problem are

- $\Omega \in C^{0,1}$.
- $a_i: \Omega \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}, i \in \{0, \dots, d\}$ are Caratheodory in $x \in \Omega$ and $(z, \mathbf{p}) \in \mathbb{R} \times \mathbb{R}^d$,
- growth condition: $\exists C > 0, r \in (1, \infty), h \in L_{r'}(\Omega) : \forall i \in \{0, \dots, d\}, \forall a.a. \ x \in \Omega, \forall z \in \mathbb{R}, \forall p \in \mathbb{R}^d : x \in \mathbb{R}^d : x \in \mathbb{R}, \forall p \in \mathbb{R}^d : x \in \mathbb{R}^$

$$|a_i(x, z, \mathbf{p})| \le C(|z|^{r-1} + |\mathbf{p}|^{r-1}) + h(x),$$

- $f \in \left(W_0^{1,r}(\Omega)\right)^*$,
- $u_0 \in W^{1,r}(\Omega)$,

and the unknown is $u: \Omega \to \mathbb{R}$.

Remark. The Nemytskii operator³⁰ $(u, \mathbf{p}) \mapsto a_i(\cdot, u, \mathbf{p})$ is continuous from $(L_r(\Omega))^{d+1}$ to $L_{r'}(\Omega)$. by Nemystkii theorem. Truly, generally, the estimate

$$|f(x,\mathbf{y})| \le g(x) + C \sum_{j=1}^{d} |y_i|^{\frac{p_i}{p}}, g \in L_p(\Omega),$$

guarantess continuity from $L_{p_1}(\Omega) \times \cdots \times L_{p_d}(\Omega)$ to $L_p(\Omega)$. So in our case, the target space is $L_{r'}(\Omega)$, since $h \in L_{r'}(\Omega)$, and the exponent from the origin space can be found by

"
$$p_i = \frac{p_i}{p}p$$
,"

i.e., taking the exponents we in fact have the estimates for and multiplying them by the target space exponent. In our case $p_i = (r-1)r' = r - 1\frac{r}{r-1} = r$.

Definition 10 (Coercivity). We say that $\{a_i\}_{i=0}^d$ is coercive if $\exists C_1 > 0, \exists C_2(x) \in L_1(\Omega) : \forall a.e. x \in \Omega, \forall (z,p) \in \mathbb{R}^{d+1} :$

$$\sum_{i=1}^{d} a_i(x, z, \mathbf{p}) p_i + a_0(x, z, \mathbf{p}) z \ge C_1 |\mathbf{p}|^r - C_2(x),$$

i.e.,

$$\mathbf{a}(x,z,\mathbf{p}) \cdot \mathbf{p} + a_0(x,z,\mathbf{p})z \ge C_1|\mathbf{p}|^r - C_2(x).$$

Definition 11 (Monotonicity). We say that $\{a_i\}_{i=0}^d$ is monotone if $\forall a.a. x \in \Omega, \forall (z_1, \mathbf{p}_1), (z_2, \mathbf{p}_2) \in \mathbb{R}^{d+1}$:

$$(\mathbf{a}(x, z_1, \mathbf{p}_1) - \mathbf{a}(x, z_2, \mathbf{p}_2)) \cdot (\mathbf{p}_1 - \mathbf{p}_2) + (a_0(x, z_1, \mathbf{p}_1) - a_0(x, z_2, \mathbf{p}_2))(z_1 - z_2) \ge 0.$$

We say $\{a_i\}_{i=0}^d$ is strictly monotone if $\forall a.a. x \in \Omega, \forall (z_1, \mathbf{p}_1,), (z_2, \mathbf{p}_2) \in \mathbb{R}^{d+1} s.t. (z_1, p_1) \neq (z_2, p_2)$ it holds

$$(\mathbf{a}(x, z_1, \mathbf{p}_1) - \mathbf{a}(x, z_2, \mathbf{p}_2)) \cdot (\mathbf{p}_1 - \mathbf{p}_2) + (a_0(x, z_1, \mathbf{p}_1) - a_0(x, z_2, \mathbf{p}_2))(z_1 - z_2) > 0.$$

Definition 12 (Weak solution). We say that $u \in W^{1,r}(\Omega)$ is a weak solution to the above problem 3 provided

$$\operatorname{tr} u = \operatorname{tr} u_0 \text{ on } \partial \Omega,$$

 $u - u_0 \in W_0^{1,r}(\Omega)$ and it holds

$$\forall \varphi \in W_0^{1,r}(\Omega) : \int_{\Omega} \mathbf{a}(\cdot, u, \nabla u) \cdot \nabla \varphi + a_0(\cdot, u, \nabla u) \varphi \, \mathrm{d}x = \langle f, \varphi \rangle_{(W^{1,r}(\Omega))^*},$$

Now comes the proof of existence and uniqueness – let us prepare for that with a useful lemma.

Lemma 10. Let $g: B(0,R) \subset \mathbb{R}^N \to \mathbb{R}^N$ be continuous, $N \in \mathbb{N}, R > 0$, and $\forall c \in S(0,R): g(c) \cdot c \geq 0$. Then, there is $c_0 \in B(0,R): g(c_0) = 0$.

³⁰Again meaning $N_{a_i}(u, \mathbf{p})(x) = a_i(x, u(x), \mathbf{p}(x))$.

Proof. By contradiction. Let $g \neq 0$ in U(0,R). Let us define

$$h(x) = -R \frac{g(x)}{|g(x)|}.$$

Then $h \in C(B(0,R)), h(B(0,R)) \subset S(0,R) \subset B(0,R)$, so by Brouwer there

$$\exists x_0 \in \mathbf{B}(0,R) : h(x_0) = x_0 \Leftrightarrow -R \frac{g(x_0)}{|g(x_0)|} = x_0.$$

Take the dot product with $x_0 \in S(0, R)$ and write

$$-R \frac{g(x_0) \cdot x_0}{|g(x_0)|} = \underbrace{|x_0|^2}_{=R^2} \land x_0 \in S(0, R),$$

so that is a contradiction.

Remark. We have in fact shown that this c_0 is from S(0,R).

Theorem 24 (Existence and uniqueness). Let $\Omega \in C^{0,1}$, $r \in (1, \infty)$, $f \in (W^{1,r}(\Omega))^*$, $u_0 \in W^{1,r}(\Omega)$, $\{a_i\}_{i=0}^d$ be Caratheodory, coercive and monotone and let them also satisfy the growth condition. Then, there is a weak solution to the problem 3. If, moreover, $\{a_i\}_{i=0}^d$ is strictly monotone, then the weak solution is unique.

Proof. The strategy is the following:

- 1. Galerkin approximation,
- 2. uniform estimates,
- 3. limit passage,
- 4. identification of limits,

One of the issues we will face is that nonlinearities may destroy weak convergence, see the below example.

Galerkin:

Since $W_0^{1,r}(\Omega)$ is separable there $\exists \{w_i\}_{i=1}^{\infty} \subset W_0^{1,r}(\Omega)$ that is a dense³¹ linearly independent subset. We search for $\{\alpha_n^j\} \subset \mathbb{R}, n \in \mathbb{N}, j \in \{1, \dots, n\}$ such that

$$u_n(x) \coloneqq u_0(x) + \sum_{j=1}^n \alpha_n^j w_j(x),$$

satisfy $\forall j \in \{1, \dots, n\}$

$$\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla w_j + a_0(x, u_n, \nabla u_n) w_j \, \mathrm{d}x = \langle f, w_j \rangle.$$

³¹It can be chosen such that it is itself dense, not only its span.

We claim such $\{\alpha_n^j\}_{j=1}^n \subset \mathbb{R}^n$ exist $\forall n \in \mathbb{N}$ by the previous lemma. We define a vector function $\mathbf{F}: \mathbb{R}^n \to \mathbb{R}^n$ (the dependence on α_n^j is through u_n)

$$\mathbf{F}(\alpha_n^1, \dots, \alpha_n^n) := \left\{ \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla w_j + a_0(x, u_n, \nabla u_n) w_j \, \mathrm{d}x - \langle f, w_j \rangle \right\}_{j=1}^n.$$

Let us show **F** is continuous (maybe more carefully then needed, but just to make it clear)

- $(\alpha_n^1, \dots, \alpha_n^n) \mapsto (u_n = u_0 + \sum_{j=1}^n \alpha_n^j w_j)$, is continuous from \mathbb{R}^n to $W^{1,r}(\Omega)$, it is just a (finite) linear combination³²
- $u_n \mapsto \nabla u_n$ is continuous from $W^{1,r}(\Omega)$ to $(L_r(\Omega))^n$, as it is linear and $\|\nabla u_n\|_{L_r(\Omega)} \le \|u_n\|_{W^{1,r}(\Omega)}$,
- $(u_n, \nabla u_n) \mapsto \mathbf{a}(\cdot, u_n, \nabla u_n)$ is continuous from $\mathbf{L}_r(\Omega) \times (\mathbf{L}_r(\Omega))^n$ to $(\mathbf{L}_{r'}(\Omega))^d$ by Nemytskii and $(u_n, \nabla u_n) \mapsto a_0(\cdot, u_n, \nabla u_n)$ is also continuous from $\mathbf{L}_r(\Omega) \times (\mathbf{L}_r(\Omega))^n$ to $\mathbf{L}_{r'}(\Omega)$ by Nemytskii,
- $I_{\nabla w_j} : \mathbf{a}(\cdot, u_n, \nabla u_n) \mapsto \mathbb{R}$, defined by $I_{\nabla w_j}(\mathbf{a}(\cdot, u_n, \nabla u_n)) = \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla w_j \, dx$, is continuos from $(L_{r'}(\Omega))^n$ to \mathbb{R} , because it is linear and $|\int_{\Omega} \mathbf{a} \cdot \nabla w_j \, dx| \le ||\mathbf{a}||_{(L_{r'}(\Omega))^n} ||\nabla w_j||_{(L_{r'}(\Omega))^n}$,
- $I_{w_j}: a_0(\cdot, u_n, \nabla u_n) \mapsto \mathbb{R}$, defined by $I_{w_j}(a_0(\cdot, u_n, \nabla u_n)) = \int_{\Omega} a_0(x, u_n, \nabla u_n) w_j \, dx$, is continuous from $L_{r'}(\Omega)$ to \mathbb{R} because it is linear and $\left| \int_{\Omega} a_0 w_j \, dx \right| \leq \|a_0\|_{L_{r}(\Omega)} \|w_j\|_{L_{r}(\Omega)}$,
- (trivially) (e.g.) $a_0(\cdot, u_n, \nabla u_n) \mapsto \langle f, w_j \rangle$ is continuous from $L_{r'}(\Omega)$ to \mathbb{R} , because it is just a constant,
- and finally (this notation is extra embarassing)

$$\left(\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla w_n \, \mathrm{d}x, \int_{\Omega} a_0(x, u_n, \nabla u_n) \, \mathrm{d}x, \langle f, w_j \rangle \right) \mapsto \left(\sum_{i=1}^n \left(\int_{\Omega} \mathbf{a} \cdot \nabla w_j + a_0 w_j \, \mathrm{d}x - \langle f, w_j \rangle \right) \mathbf{e}_i \right) = \left\{\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot w_j + a_0(x, u_n, \nabla u_n) w_j \, \mathrm{d}x - \langle f, w_j \rangle \right\}_{j=1}^n$$

is continuous from $\mathbb{R} \times \mathbb{R} \times \mathbb{R}$ to \mathbb{R}^n , because it is just a finite linear combination ("assembly of the vector").

On total, we get $(\alpha_n^1, \ldots, \alpha_n^n) \mapsto \mathbf{F}(\alpha_n^1, \ldots, \alpha_n^n)$ is continuous from \mathbb{R}^n to \mathbb{R}^n , as it is just a composition of continuous mappings (listed above in the right order). Next, compute (realize $u_n - u_0 = \sum_{i=1}^n \alpha_n^i w_n$)

$$\mathbf{F}(\boldsymbol{\alpha}_n) \cdot \boldsymbol{\alpha}_n = \sum_{i=1}^n \alpha_n^i \left(\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot w_i + a_0(x, u_n, \nabla u_n) \, \mathrm{d}x - \langle f, w_i \rangle \right) =$$

$$= \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla(u_n - u_0) + a_0(x, u_n, \nabla u_n) (u_n - u_0) \, \mathrm{d}x - \langle f, u_n - u_0 \rangle.$$

This can be further manipulated by using coercivity, one has (also with the help of Cauchy and Schwarz)

$$\mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla (u_n - u_0) + a_0(x, u_n, \nabla u_n)(u_n - u_0) \ge C_1 |\nabla u_n|^r - C_2(x) - \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla u_0 - a_0(x, u_n, \nabla u_n)u_0, \\ \ge C_1 |\nabla u_n|^r - (C_2(x) + |\mathbf{a}(\dots)||\nabla u_0| + |a_0(\dots)||u_0|),$$

³²And +, • is continuous on normed spaces...

so we can write (notice we do not split $u_n - u_0$)

$$\int_{\Omega} \mathbf{a}(x, u_{n}, \nabla u_{n}) \cdot \nabla(u_{n} - u_{0}) + a_{0}(x, u_{n}, \nabla u_{n})(u_{n} - u_{0}) \, dx - \langle f, u_{n} - u_{0} \rangle \ge
\ge \int_{\Omega} \left(C_{1} |\nabla u_{n}|^{r} - C_{2}(x) - |\mathbf{a}(\dots)| |\nabla u_{0}| - |a_{0}(\dots)| |u_{0}| \right) \, dx - ||f||_{(\mathbf{W}^{1,r}(\Omega))^{*}} ||u_{n} - u_{0}||_{\mathbf{W}^{1,r}(\Omega)} \ge
\ge C_{1} ||\nabla u_{n}||_{\mathbf{L}_{r}(\Omega)}^{r} - ||C_{2}||_{\mathbf{L}_{1}(\Omega)} - ||f||_{(\mathbf{W}^{1,r}(\Omega))^{*}} ||u_{n} - u_{0}||_{\mathbf{W}^{1,r}(\Omega)} - \int_{\Omega} |\mathbf{a}(\dots)| |\nabla u_{0}| + |a_{0}(\dots)| |u_{0}| \, dx.$$

Let us now estimate. The first term can be rewritten using triangle inequality and Poincare as

$$\|\nabla u_n\|_{\mathbf{L}_r(\Omega)}^r = \|\nabla u_n\|_{\mathbf{L}_r(\Omega)}\|^r \ge \|\nabla (u_n - u_0)\|_{\mathbf{L}_r(\Omega)} - \|\nabla u_0\|_{\mathbf{L}_r(\Omega)}\|^r \ge \|\nabla (u_n - u_0)\|_{\mathbf{L}_r(\Omega)}^r - \|\nabla u_0\|_{\mathbf{L}_r(\Omega)}^r \le C\|u_n - u_0\|_{\mathbf{W}^{1,r}(\Omega)}^r - \|\nabla u_0\|_{\mathbf{L}_r(\Omega)}^r \le C\|u_n - u_0\|_{\mathbf{W}^{1,r}(\Omega)}^r - \|\nabla u_0\|_{\mathbf{L}_r(\Omega)}^r,$$

where we made the constant C larger without renaming it to obtain a positive quantity. Next, we can estimate the integral with a_0 , **a** from growth conditions:

$$|a_{0}(x, u_{n}, \nabla u_{n})| \leq h(x) + C(|u_{n}|^{r-1} + |\nabla u_{n}|^{r-1}),$$

$$|\mathbf{a}(x, u_{n}, \nabla u_{n})| \leq C(d) \sum_{i=1}^{d} |a_{i}(x, u_{n}, \nabla u_{n})| \leq C(d) d(h(x) + C(|u_{n}|^{r-1} + |\nabla u_{n}|^{r-1})),$$

so the integral becomes

$$\begin{split} &\int_{\Omega} |\mathbf{a}| |\nabla u_0| + |a_0| |u_0| \, \mathrm{d}x \leq \\ &\leq \int_{\Omega} |h| |u_0| + C|u_0| |u_n|^{r-1} + C|u_0| |\nabla u_n|^{r-1} \, \mathrm{d}x + C(d) d \int_{\Omega} |h| |\nabla u_0| + C|u_n|^{r-1} |\nabla u_0| + C|\nabla u_n|^{r-1} |\nabla u_0| \, \mathrm{d}x \leq \\ &\leq \|h\|_{\mathbf{L}_{r'}(\Omega)} \|u_0\|_{\mathbf{L}_{r}(\Omega)} + C\|u_0\|_{\mathbf{L}_{r}(\Omega)} \|u_n\|_{\mathbf{L}_{r}(\Omega)}^{r-1} + C\|u_0\|_{\mathbf{L}_{r}(\Omega)} \|\nabla u_n\|_{\mathbf{L}_{r}(\Omega)}^{r-1} + \\ &+ C(d) d \Big(\|h\|_{\mathbf{L}_{r'}(\Omega)} \|\nabla u_0\|_{\mathbf{L}_{r}(\Omega)}^{r-1} + C\|u_n\|_{\mathbf{L}_{r}(\Omega)}^{r-1} \|\nabla u_0\|_{\mathbf{L}_{r}(\Omega)} + \|\nabla u_n\|_{\mathbf{L}_{r}(\Omega)}^{r-1} \|\nabla u_0\|_{\mathbf{L}_{r}(\Omega)} \Big), \end{split}$$

this is a lot of terms, but it gets easier when i use Poincare and estimate everything w.r.t. $\|\nabla u_n\|_{\mathbf{L}_q(\Omega)}$:

$$\leq \|h\|_{\mathcal{L}_{r}(\Omega)} \|u_0\|_{\mathcal{L}_{r}(\Omega)} + \|h\|_{\mathcal{L}_{r}(\Omega)} \|\nabla u_0\|_{\mathcal{L}_{r}(\Omega)}^{r-1} + \|\nabla u_n\|_{\mathcal{L}_{r}(\Omega)}^{r-1} \Big(C\|u_0\|_{\mathcal{L}_{r}(\Omega)} + C\|u_0\|_{\mathcal{L}_{r}(\Omega)} + C(d)d\Big(\|\nabla u_0\|_{\mathcal{L}_{r}(\Omega)} + \|\nabla u_0\|_{\mathcal{L}_{r}(\Omega)}\Big)\Big),$$

now use Young inequality:

$$|ab| \leq \frac{a^p}{p} + \frac{b^q}{q}, \frac{1}{p} + \frac{1}{q} = 1,$$

so in particular

$$|ab| \le \frac{a^r}{r} + \frac{b^{\frac{r}{r-1}}}{\frac{r}{r-1}}.$$

Using this and going for the maximum over all constants gives (realize that also h is given)

$$\leq C \Big(\|u_0\|_{\mathbf{L}_r(\Omega)}^r + \|\nabla u_0\|_{\mathbf{L}_r(\Omega)}^r + \|\nabla u_n\|_{\mathbf{L}_r(\Omega)}^r \Big).$$

Upon combining the above estimations, we obtain (constants are changing from line to line and do not really make sense)

$$\mathbf{F}(\boldsymbol{\alpha}_{n}) \cdot \boldsymbol{\alpha}_{n} \geq C_{1} \| \nabla u_{n} \|_{\mathbf{L}_{r}(\Omega)}^{r} - \| C_{2} \|_{\mathbf{L}_{1}(\Omega)} - \| f \|_{(\mathbf{W}^{1,r}(\Omega))^{*}} \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)} - C \Big(\| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| \nabla u_{n} \|_{\mathbf{L}_{r}(\Omega)}^{r} \Big) \geq C_{1} \Big(C \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r} - \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \Big) - \| C_{2} \|_{\mathbf{L}_{1}(\Omega)} - \underbrace{\| f \|_{(\mathbf{W}^{1,r}(\Omega))^{*}} \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r}}_{\text{Younge}} + C \Big(\| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + C \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r} - \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \Big) \geq C_{1} \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r} - C_{2} \Big(\underbrace{1}_{\| C_{2} \|_{\mathbf{L}_{1}(\Omega)} \dots} + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \| f \|_{\mathbf{W}^{1,r}(\Omega)}^{r'} \Big) \Big),$$

so we have

$$\mathbf{F}(\boldsymbol{\alpha}_{n}) \cdot \boldsymbol{\alpha}_{n} \geq C_{1} \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r} - C_{2} \left(1 + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \| f \|_{(\mathbf{W}^{1,r}(\Omega))^{*}}^{r'} \right)$$

which is very nice, as it depends on data mostly. As for the first term, realize

$$u_n - u_0 = \sum_{j=1}^n \alpha_n^j w_n \Rightarrow \|u_n - u_0\|_{W^{1,r}(\Omega)} = \|\boldsymbol{\alpha}_n \cdot (w_1, \dots, w_n)\|_{W^{1,r}(\Omega)},$$

which seems trivial, but from the properties of the norm and the fact $\{w_n\}$ are linearly independent, the mapping

$$\mathbb{R}^{n} \ni \alpha_{n} \mapsto \|u^{n} - u_{0}\|_{\mathbf{W}^{1,r}(\Omega)}, \|u_{n} - u_{0}\|_{\mathbf{W}^{1,r}(\Omega)} = \|\alpha_{n} \cdot (w_{1}, \dots, w_{n})\|_{\mathbf{W}^{1,r}(\Omega)},$$

is a norm on \mathbb{R}^n . And since all norms on finite dimensional spaces are equivalent, there exists $K_1(n) > 0$ s.t.

$$\forall \alpha \in \mathbb{R}^n : K_1(n)|\alpha_n| \leq ||u^n - u_0||_{W^{1,r}(\Omega)}.$$

But this means

$$\mathbf{F}(\boldsymbol{\alpha}_{n}) \cdot \boldsymbol{\alpha}_{n} \geq C_{1} \| u_{n} - u_{0} \|_{\mathbf{W}^{1,r}(\Omega)}^{r} - C_{2} \Big(1 + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \| f \|_{\mathbf{W}^{1,r}(\Omega)}^{r'} \Big)$$

$$\geq K_{1}(n) C_{1} |\boldsymbol{\alpha}_{n}|^{r} - C_{2} \Big(1 + \| \nabla u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} + \| u_{0} \|_{\mathbf{L}_{r}(\Omega)}^{r} \| f \|_{\mathbf{W}^{1,r}(\Omega)}^{r'} \Big),$$

i.e., if we choose α_n so that its norm is large enough, the above product stays always positive. So, in other words:

$$\exists R > 0, \forall \alpha_n \in S(0, R) \subset \mathbb{R}^n : \mathbf{F}(\alpha_n) \cdot \alpha_n > 0,$$

and hence by the previous lemma

$$\exists \boldsymbol{\alpha}_n \in \mathrm{S}(0,R) : \mathbf{F}(\boldsymbol{\alpha}_n) = 0,$$

and we fix these $\alpha_n = (\alpha_n^1, \dots, \alpha_n^n)$ from now on.

Uniform estimates

They follow from the previous manipulation: since we have $\mathbf{F}(\alpha_n) \cdot \alpha_n = 0$

$$||u_n - u_0||_{W^{1,r}(\Omega)}^r \le C(1 + ||u_0||_{W^{1,r}(\Omega)}^r + ||f||_{W^{1,r}(\Omega))^*}^{r'}),$$

and so

$$||u_n||_{\mathbf{W}^{1,r}(\Omega)} \le C(1 + ||u_0||_{\mathbf{W}^{1,r}(\Omega)}^r + ||f||_{(\mathbf{W}^{1,r}(\Omega))^*}^{r'}),$$

together with (just take the $\|\cdot\|_{L_{r}(\Omega)}^{r'}$ norm of the growth estimates and use the above two)

$$\forall j \in \{0, \dots, d\} : \|a_j(x, u_n, \nabla u_n)\|_{\mathbf{L}_{r'}(\Omega)}^{r'} \le C \Big(1 + \|u_0\|_{\mathbf{W}^{1, r}(\Omega)}^{r} + \|f\|_{(\mathbf{W}^{1, r}(\Omega))^*}^{r'}\Big),$$

Limit passage

Since the sequences $\{u_n\}, \{a_i(\cdot, u_n, \nabla u_n)\}\$ are uniformly bounded, from the separability of the spaces we can extract sequences (not renamed):

$$u^n \rightarrow u \text{ in W}^{1,r}(\Omega), a_j \rightarrow b_j \text{ in L}_{r'}(\Omega), j \in \{0, \dots, d\}.$$

The weak convergences allow us to write

$$\lim_{n \to \infty} \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot w_j + a_0(x, u_n, \nabla u_n) w_j \, \mathrm{d}x - \langle f, w_j \rangle = \int_{\Omega} \mathbf{b} \cdot \nabla w_j + b_0 \cdot w_j \, \mathrm{d}x - \langle f, w_j \rangle, \forall j \in \mathbb{N}$$

and so

$$\forall j \in \mathbb{N} \int_{\Omega} \mathbf{b} \cdot \nabla w_j + b_0 w_j \, \mathrm{d}x = \langle f, w_j \rangle.$$

And since $\{w_j\}_{j\in\mathbb{N}}$ is dense in $W_0^{1,r}(\Omega)$ (plus the convergences and linearity of the integral) we have

$$\forall \varphi \in W_0^{1,r}(\Omega) : \int_{\Omega} \mathbf{b} \cdot \nabla \varphi + b_0 \varphi \, \mathrm{d}x = \langle f, \varphi \rangle.$$

Identification of α 's

To solve the problem, we need to show that actually $b_j(x) = a_j(x, u, \nabla u), \forall j \in \{0, ..., d\}$. For that, we use monotonicity & the *Minty trick*: take $u_n, \nabla u_n, v, \mathbf{V}$ together with monotonicity

$$0 \leq \int_{\Omega} (\mathbf{a}(x, u_n, \nabla u_n) - \mathbf{a}(x, v, \mathbf{V})) \cdot (\nabla u_n - \mathbf{V}) + (a_0(x, u_n, \nabla u_n) - a_0(x, v, \mathbf{V}))(u_n - v) \, dx =$$

$$= \underbrace{\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla u_n + a_0(x, u_n, \nabla u_n) u_n \, dx}_{=I_n} + \underbrace{\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla u_n + a_0(x, u_n, \nabla u_n) v + a_0(x, v, \mathbf{V}) u_n \, dx + \int_{\Omega} \mathbf{a}(x, v, \mathbf{V}) \cdot \mathbf{V} + a_0(x, v, \mathbf{V}) v \, dx}_{=I_n}$$

If we now denote (just the first line)

$$I_n = \underbrace{\int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla(u_n - u_0) + a_0(x, u_n, \nabla u_n) \cdot (u_n - u_0)}_{= \langle f, u_n - u_0 \rangle} + \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla u_0 + a_0(x, u_n, \nabla u_n) u_0 \, \mathrm{d}x,$$

we may write (realize $u_n - u_0 = \sum_{j=1}^n \alpha_n^j w_j$, and as the equation is valid with testing by w_j , it is valid when testing with $u_n - u_0$) by using the equation

$$I_n = \langle f, u_n - u_0 \rangle + \int_{\Omega} \mathbf{a}(x, u_n, \nabla u_n) \cdot \nabla u_0 + a_0(x, u_n, \nabla u_n) u_0 \, \mathrm{d}x,$$

but the limit of that is

$$\lim_{n\to\infty}I_n=\langle f,u-u_0\rangle+\int_{\Omega}\mathbf{b}\cdot\nabla u_0+b_0u_0\,\mathrm{d}x=\int_{\Omega}\mathbf{b}\cdot\nabla(u-u_0)+b_0(u-u_0)\,\mathrm{d}x+\int_{\Omega}\mathbf{b}\cdot\nabla u_0+b_0u_0\,\mathrm{d}x=\int_{\Omega}\mathbf{b}\cdot\nabla u+b_0u\,\mathrm{d}x\,,$$

as the rest has subtracted. Taking this back to the original estimate and passing to the limit yields

$$0 \leq \int_{\Omega} \mathbf{b} \cdot \nabla u + b_0 u - \mathbf{b} \cdot \mathbf{V} - \mathbf{a}(x, v, \mathbf{V}) \cdot \nabla u - b_0 v - a_0(x, v, \mathbf{V}) u + \mathbf{a}(x, v, \mathbf{V}) \cdot \mathbf{V} + a_0(x, v, \mathbf{V}) v \, dx =$$

$$= \int_{\Omega} \mathbf{b} \cdot (\nabla u - \mathbf{V}) + b_0(u - v) - \mathbf{a}(x, v, \mathbf{V}) \cdot (\nabla u - \mathbf{V}) - a_0(x, v, \mathbf{V}) (u - v) \, dx =$$

$$= \int_{\Omega} (\mathbf{b} - \mathbf{a}(x, v, \mathbf{V})) \cdot (\nabla u - \mathbf{V}) + (b_0 - a_0(x, v, \mathbf{V}) (u - v)) \, dx$$

So far, v, \mathbf{V} have been arbitrary. If we take them now as

$$V = \nabla u - \lambda \mathbf{g}, \mathbf{g} \in L_r(\Omega), v = u,$$

then

$$0 \le \int_{\Omega} \lambda \mathbf{g} \cdot (\mathbf{b} - \mathbf{a}(x, u, \nabla u - \lambda \mathbf{g})) \, \mathrm{d}x.$$

Also λ is of our choosing - if it is $\lambda > 0$, we can divide the inequality by it and pass to the limit $\lambda \to 0_+$ (using Nemytski and continuity in the variables of **a**); this yields

$$0 \le \int_{\Omega} \mathbf{g} \cdot (\mathbf{b} - \mathbf{a}(x, u, \nabla u)) \, \mathrm{d}x.$$

Since \mathbf{g} was arbitrary, we could have taken $\mathbf{g} \to -\mathbf{g}$, which would lead to

$$0 \ge \int_{\Omega} \mathbf{g} \cdot (\mathbf{b} - \mathbf{a}(x, u, \nabla u)) \, \mathrm{d}x,$$

 \mathbf{so}

$$\int_{\Omega} \mathbf{g} \cdot (\mathbf{b} - \mathbf{a}(x, u, \nabla u)) \, \mathrm{d}x = 0, \, \forall \mathbf{g} \in L_r(\Omega).$$

Using the Fundamental lemma of the calculus of variation, we see this must really mean

$$\mathbf{b} = \mathbf{a}(x, u, \nabla u), \ a.e. \text{ in } \Omega.$$

Differently, we could argue that $\mathbf{b} = \mathbf{a}(x, u, \nabla u)$ in $L_{r'}(\Omega) = (L_r(\Omega))^*$. almost everywhere. So from the previous results, we obtain

$$\forall \varphi \in W_0^{1,r}(\Omega): \int_{\Omega} \mathbf{a}(x,u,\nabla u) \nabla \varphi + a_0(x,u,\nabla u) \varphi \, \mathrm{d}x = \langle f, \varphi \rangle,$$

and we are almost done. It only remains to show the traces are correct, but since $u_n \rightharpoonup u$ in $W^{1,r}(\Omega)$ and the trace operator is continuous, we immediately have

$$\operatorname{tr} u = \operatorname{tr} u_0$$
.

Uniqueness: Let u_1, u_2 be two solutions. Then Use strict monotonicity, subtract the weak formulation and test with $u_2 - u_1$:

$$\int_{\Omega} \mathbf{a}(x, u_1, \nabla u_1) \cdot \varphi + a_0(x, u_1, \nabla u_1) \, \mathrm{d}x = \langle f, \varphi \rangle,$$

and

$$\int_{\Omega} \mathbf{a}(x, u_2, \nabla u_2) \cdot \varphi + a_0(x, u_2, \nabla u_2) \, \mathrm{d}x = \langle f, \varphi \rangle,$$

so subtracting the two and taking $\varphi = u_1 - u_2 = (u_1 - u_0) - (u_2 - u_0) \in W_0^{1,r}(\Omega)$ yields

$$\int_{\Omega} (\mathbf{a}(x, u_2, \nabla u_2) - \mathbf{a}(x, u_1, \nabla u_1)) \cdot \nabla (u_2 - u_1) + (a_0(x, u_2, \nabla u_2) - a_0(x, u_1, \nabla u_1))(u_2 - u_1) dx = 0,$$

with the integrand being nonnegative from monotonicity. But if we also have strict monotonocity, this would have to be strictly positive if $u_1 \neq u_2$ - and since it is zero, then it must mean $(u_1, \nabla u_1) = (u_2, \nabla u_2)$ a.e. in Ω , and so really $u_1 = u_2$ in $W^{1,r}(\Omega)$.

Example (Nonlinearities vs weak convergence). Let $g_n(x) = \sin(nx)$, then $g \to 0$ in $L_2((0,4))$ (Riemann-Lebesgue lemma). However,

$$\int_0^4 \sin^2(nx)\varphi \, \mathrm{d}x \ge \int_2^4 \sin^2(nx) \, \mathrm{d}x \to \frac{1}{2} \ne 0, \forall \varphi \in \mathrm{L}_2((0,4)),$$

so $\{u_n^2\} = \{\sin^2(nx)\}$ does not converge weakly to $0 = 0^2$.

Remark. It might seem that when dealing with nonlinear elliptic equation with a monotone coercive operator, it might seem one only needs to check the assumptions and then almost blindly use this theorem. However, the class of problems we can solve with the above procedure is quite broader than just the ones we discussed, but one needs to be a bit creative. So, it if benificial to think of the "proof" we have given above as not a typical proof of a mathematical statement, but rather as a procedure of solving similiar kinds of problems.

5 Calculus of variations

Our motivation is the following: search for a point of minimum for a mapping $I: X \mapsto \mathbb{R}$

$$I(u) = \int_{\Omega} F(x, u, \nabla u) \, \mathrm{d}x,$$

with some basic assumptions:

- $\Omega \in \mathbb{C}^{0,1}$,
- $r \in (1, \infty)$,
- $X = u_0 + W_0^{1,r}(\Omega)$, for some $u_0 \in W^{1,r}(\Omega)$,
- $F: \Omega \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}$ that is Caratheodory in x and (z, \mathbf{p}) with the following coercivity condition:

$$\exists C_1 > 0, C_2 \in L_1(\Omega)$$
, a.e. $x \in \Omega, \forall z \in \mathbb{R}, \forall p \in \mathbb{R}^d : F(x, z, p) \ge C_1 |p|^r - C_2(x)$.

Remark. • from the assumptions it follows $\int_{\Omega} F(\cdot, u, \nabla u) dx$ is defined $\forall u \in W^{1,r}(\Omega)$,

- notice the setting is very similar to the nonlinear equations previously,
- the fact $u \in u_0 + W_0^{1,r}(\Omega)$, $u_0 \in W^{1,r}(\Omega)$, is nothing new even it the previous chapter we had $u_0 \in W^{1,r}(\Omega)$, $u \in W^{1,r}(\Omega)$ s.t. $u u_0 \in W_0^{1,r}(\Omega)$. Also, since we know $W_0^{1,r}(\Omega)$ is a closed subspace of $W^{1,r}(\Omega)$, the structure $u_0 + W_0^{1,r}(\Omega)$ is exactly that of a factorspace.

The connection between PDE's and calculus of variations is presented in the following lemma.

Lemma 11. Let $\Omega \in C^{0,1}$, $r \in (1, \infty)$, $X = u_0 + W_0^{1,r}(\Omega)$, $u_0 \in W^{1,r}(\Omega)$, F Caratheodory. Moreover, let the following condition hold: $\exists C > 0, h \in L_1(\Omega)$ such that

$$\forall a.ax \in \Omega, \forall z \in \mathbb{R}, \forall p \in \mathbb{R}^d : |\nabla_p F(x, z, p)| + |\partial_z F(x, z, p)| \le h(x) + C(|z|^r + |p|^r),$$

and let moreover $F(x, \cdot, \cdot) \in C^1(\mathbb{R}^{d+1})$ for a.a. $x \in \Omega$.

Let now $u \in X$ be a local minimizer of I over X, i.e., $I(u) < \infty$ and

$$\exists \rho > 0 : \forall v \in \mathcal{D}(\Omega), \|v\|_{W^{1,r}(\Omega)} < \rho \Rightarrow I(u) \le I(v).$$

Then u is the weak solution to the **Euler-Lagrange equations**:

$$-\nabla \cdot (\nabla_p F(x, u, \nabla u) + \partial_z F(x, u, \nabla u)) = 0, \text{ in } \Omega$$
$$u = u_0, \text{ on } \partial \Omega,$$

i.e.,

$$\forall \varphi \in \mathcal{D}(\Omega) : \int_{\Omega} \nabla_p F(x, u, \nabla u) \cdot \nabla \varphi + \partial_z F(x, u, \nabla u) \varphi \, \mathrm{d}x = 0,$$

and $\operatorname{tr} u = \operatorname{tr} u_0$ on $\partial \Omega$.

Proof. First, if $u \in u_0 + W_0^{1,r}(\Omega)$, then $\operatorname{tr} u = \operatorname{tr} u_0$ and that is true. Now fix some $\varphi \in \mathcal{D}(\Omega)$ and define

$$\iota: \mathbb{R} \to \mathbb{R}^* : \iota(t) = \int_{\Omega} F(x, u + t\varphi, \nabla(u + t\varphi)) \, \mathrm{d}x.$$

Since now u minimizes I, we see ι has a (local) minimum at 0. We will show $\iota'(0)$ exists and is equal to the Euler-Lagrange equations. Denote now

$$l(\cdot, t) = F(\cdot, u + t\varphi, \nabla(u + t\varphi),$$

for $t \in \mathbb{R}$. To do that, we would like to swap the derivative and the integral, namely to write

$$\partial_t \iota(t) = \partial_t \int_{\Omega} l(\cdot, t) dx = \int_{\Omega} \partial_t l(\cdot, t) dx.$$

To do that, we have to check the assumptions:

- measurability of $l(\cdot, t)$,
- differentiability of $l(\cdot,t)$,

- majorant for the derivative,
- \bullet convergence of the integral on some neighbourhood of t.

Recall that from our assumptions (F is Caratheodory + smoothness)

- $F(\cdot, z, \mathbf{p})$ is continuous $\forall (z, \mathbf{p}) \in \mathbb{R} \times \mathbb{R}^d \Rightarrow l(\cdot, t)$ is measurable. so in particular it is measurable on some neighbourhood of t = 0,
- $F(x, \cdot, \cdot) \in C^1(\mathbb{R}^{d+1}) \Rightarrow l(\cdot, t)$ is differentiable w.r.t t.

It is hence valid to now compute $\partial_t l(\cdot, t)$

$$\partial_t l(\cdot, t) = \partial_z F(\cdot, u + t\varphi, \nabla(u + t\varphi))\varphi + \nabla_p F(\cdot, u + t\varphi, \nabla(u + t\varphi)) \cdot \nabla\varphi.$$

We have a nice majorant for this expression straight from the assumptions:

$$|\partial_t l(\cdot,t)| = |\partial_z F(\cdot, u + t\varphi, \nabla(u + t\varphi))\varphi + \nabla_p F(\cdot, u + t\varphi, \nabla(u + t\varphi)) \cdot \nabla\varphi| \le 2(|h(\cdot)| + C(|u + t\varphi|^r + |\nabla(u + t\varphi)|^r))(|\varphi| + |\nabla\varphi|),$$

which is in $L_1(\Omega)$ for $h \in L_1(\Omega)$, $u \in W^{1,r}(\Omega)$, $\varphi \in \mathcal{D}(\Omega)$. Also from the assumption u is a local minimizer we have

$$i(0) = \int_{\Omega} F(\cdot, u, \nabla u) \, \mathrm{d}x < \infty$$

Altogether, we have checked the necessary assumption, and we see that $\iota'(0)$ exists and is equal to

$$\iota'(0) = \int_{\Omega} \partial_z F(\cdot, u, \nabla u) \varphi + \nabla_p F(\cdot, u, \nabla u) \cdot \nabla \varphi \, dx = 0.$$

Example. Let

$$F(x,z,p) = \frac{1}{r}(1) + |p|^2)^{\frac{r}{2}} - gz - Gp,$$

then

$$-\nabla_p F(x,z,p) = \left(\frac{r}{2} \frac{1}{r} 2(1+|p|^2)^{\frac{r-2}{2}}\right) p - G = \left(1+|p|^2\right)^{\frac{r-2}{2}} p - G, \partial_z F(x,z,p) = -g.$$

We have

$$|\left(1+|p|^{2\frac{r-2}{2}}\right)p| \leq \left(1+|p|^{2}\right)^{\frac{r-2}{2}}\left(1+|p|^{2}\right)^{\frac{1}{2}} = \left(1+|p|^{2}\right)^{\frac{r-1}{2}} \leq C(1+|p|^{r}).$$

So the estimates are met (somehow with some fantasy). The Euler-Lagrange equations are

$$\begin{cases} -\nabla \cdot \left(\left(1 + |\nabla u|^2 \right)^{\frac{r-2}{2}} \nabla u \right) = -\nabla \cdot G + g, & \text{in } \Omega \\ u = u_0, & \text{on } \partial \Omega. \end{cases},$$

whereas their weak form:

$$\forall \varphi \in \mathcal{D}(\Omega) : \int_{\Omega} \left(1 + |\nabla u|^2 \right)^{\frac{r-2}{2}} \nabla u \cdot \nabla \varphi \, \mathrm{d}x = \int_{\Omega} \left(G \cdot \nabla \varphi + g \varphi \right) \, \mathrm{d}x.$$

We see that finding a minimizer is equivalent to solving the Euler-Lagrange equations. But how to find the minimizer? The approach is the following:

Remark (General approach). • find some minimizing sequence $:\{u_n\} \subset X$ such that

$$\lim_{n\to\infty}I(u_n)=\inf_XI.$$

• we would then like to find the minimizer as some sort of a limit of $\{u_n\}$ - we need some kind of convergence or compactness. In our case, we will use weak convergence, thus from some compactness result, we will want to show

$$u_n \rightharpoonup u$$

for some u,

• to check that actually I(u) is the minimum of I, we need some kind of continuity of I - in our case, weak sequential lower semicontinuity will be enough:

$$I(u) \le \liminf_{n \to \infty} I(u_n)$$
, as $u_n \to u$.

In the following, we try to derive some sufficient conditions for the functional $I = \int_{\Omega} F(x, u, \nabla u) dx$ to be weakly sequentially lower semicontinuous, *i.e.*, some conditions for $F(x, u, \nabla u)$.

Lemma 12. Let $N \in \mathbb{N}, F : \mathbb{R}^N \to \mathbb{R}, F \in C^1(\mathbb{R}^N)$. Then

- 1. F is (strictly) convex $\Leftrightarrow \nabla F$ is (strictly) monotone
- 2. If F is (strictly) convex, then

$$\forall \xi_1, \xi_2 \in \mathbb{R}^N, \xi_1 \neq \xi_2 : F(\xi_1) - F(\xi_2) \ge \nabla F(\xi_2) \cdot (\xi_1 - \xi_2).$$

Proof. Fix $\xi_1, \xi_2, \xi_1 \neq \xi_2$, define $\varphi(t) = F(\xi_2 + t(\xi_1 - \xi_2))$. Then $\varphi \in C^1(\mathbb{R})$ and it is also (strictly) convex: $\forall s, t \in \mathbb{R}$:

$$\varphi(\lambda s + (1 - \lambda)t) = F(\xi_2 + (\lambda t + (1 - \lambda)s)(\xi_1 - \xi_2)) = F(\lambda(\xi_2 + t(\xi_1 - \xi_2)) - \lambda \xi_2 + \xi_2 + (1 - \lambda)s(\xi_1 - \xi_2)) =$$

$$= F(\lambda(\xi_2 + t(\xi_1 - \xi_2)) + (1 - \lambda)(\xi_2 + s(\xi_1 - \xi_2))) \le$$

$$\le \lambda F(\xi_2 + t(\xi_1 - \xi_2)) + (1 - \lambda)F(\xi_2 + s(\xi_1 - \xi_2)) = \lambda \varphi(s) + (1 - \lambda)\varphi(s).$$

The derivative of φ is

$$\varphi'(t) = \nabla F(\xi_2 + t(\xi_1 - \xi_2)) \cdot (\xi_1 - \xi_2),$$

and so

"
$$\Rightarrow$$
 " : $(\nabla F(\xi_1) - \nabla F(\xi_2)) \cdot (\xi_1 - \xi_2) = \varphi'(1) - \varphi'(0) \ge 0$,

if φ is (strictly) convex.

And " \Leftarrow ": Fix $t_1 > t_2$ and compute

$$(t_1 - t_2)(\varphi'(t_1) - \varphi'(t_2)) = (\nabla F(\xi_2 + t_1(\xi_1 - \xi_2)) - \nabla F(\xi_2 + t_2(\xi_1 - \xi_2))) \cdot (\xi_1 - \xi_2)(t_1 - t_2),$$

define

$$\eta_1 - \eta_2 = (\xi_1 - \xi_2)(t_1 - t_2)$$

and we obtain

$$(t_1 - t_2)(\varphi'(t_1) - \varphi'(t_2)) = (\nabla F(\eta_1) - \nabla F(\eta_2)) \cdot (\eta_1 - \eta_2)$$

and so if the ∇F is (strictly) monotonous, the LHS is (strictly) positive, meaning (strict) convexity of φ .

For 2) we already know F (strictly) convex $\Rightarrow \varphi$ (strictly) convex, and moreover realize

$$\varphi(t) = \varphi(t \cdot 1 + (1 - t) \cdot 0) \le t\varphi(1) + (1 - t)\varphi(0),$$

meaning

$$\Rightarrow \forall t \in \left(0, \frac{1}{2}\right) : \frac{\varphi(1) - \varphi(0)}{1} \ge \frac{\varphi(t) - \varphi(0)}{t} \to \varphi'(0),$$

as $t \to 0_+$. And so $\varphi(1) - \varphi(0) \ge \varphi'(0)$, which is exactly the same as

$$F(\xi_1) - F(\xi_2) \ge \nabla F(\xi_2) \cdot (\xi_1 - \xi_2).$$

Theorem 25 (Sequential weak lower semicontinuity). Let $N, M \in \mathbb{N}, \Omega$ be open and $F(x, \mathbf{z}, \mathbf{p}) : \Omega \times \mathbb{R}^N \times \mathbb{R}^M \to \mathbb{R}$ be Caratheodory and convex in \mathbf{p} . Let moreover $\exists C(x) \in L_1(\Omega)$ such that

$$\forall \ a.a. \ x \in \Omega, \forall (\mathbf{z}, \mathbf{p}) \in \mathbb{R}^{N+M} : F(x, \mathbf{z}, \mathbf{p}) \ge C(x).$$

Let $\{\mathbf{u_n}\} \subset L_1(\Omega)$ converge to \mathbf{u} in $L_1(\Omega)$, $\mathbf{u}_n \to \mathbf{u}$ and let $\{\mathbf{U}_n\} \subset L_1(\Omega)$ converge weakly to \mathbf{U} in $L_1(\Omega)$, $\mathbf{U}_n \to \mathbf{U}$. Then it holds

$$\int_{\Omega} F(x, \mathbf{u}, \mathbf{U}) dx \le \liminf_{n \to \infty} \int_{\Omega} F(x, \mathbf{u}_n, \mathbf{U}_n) dx$$

Proof. The proof will be given only if moreover $\forall a.e. x \in \Omega, \forall z \in \mathbb{R}^M : F(x, z, \cdot) \in C^1(\mathbb{R}^N)$. The main idea is the following: by the previous lemma:

$$\int_{\Omega} F(\cdot, \mathbf{u}_n, \mathbf{U}_n) dx \ge \int_{\Omega} (F(\cdot, \mathbf{u}_n, \mathbf{U}) + \nabla_p F(\cdot, \mathbf{u}_n, \mathbf{U}) \cdot (\mathbf{U}_n - \mathbf{U})) dx,$$

Since $\{\mathbf{u}_n\}$ converges strongly in $L_1(\Omega)$, there is a (not renamed) subsequence converging a.e. in Ω . By Egorov theorem that means

$$\forall \varepsilon > 0 \exists \Omega_{\varepsilon} \subset \Omega : \mathbf{u}_n \to \mathbf{u}_n, \lambda(\Omega/\Omega_{\varepsilon}) < \varepsilon.$$

Let us then write (we are using the fact $F(x, \mathbf{z}, \mathbf{p}) - C(x) \ge 0$.)

$$\int_{\Omega} F(x, \mathbf{u}_{n}, \mathbf{U}_{n}) dx = \int_{\Omega} (F(x, \mathbf{u}_{n}, \mathbf{U}_{n}) - C(x)) dx + \int_{\Omega} C(x) dx \ge
\ge \int_{\Omega_{\varepsilon}} F(x, \mathbf{u}_{n}, \mathbf{U}) - C(x) dx + \int_{\Omega_{\varepsilon}} F(x, \mathbf{u}_{n}, \mathbf{U}_{n}) - F(x, \mathbf{u}_{n}, \mathbf{U}) dx + \int_{\Omega} C(x) dx \ge
\ge \int_{\Omega_{\varepsilon}} F(x, \mathbf{u}_{n}, \mathbf{U}) - C(x) dx + \int_{\Omega_{\varepsilon}} \nabla_{p} F(x, \mathbf{u}_{n}, \mathbf{U}) \cdot (\mathbf{U}_{n} - \mathbf{U}) dx + \int_{\Omega} C(x) dx.$$

Now we take the limes inferior of both sides and write

$$\lim_{n \to \infty} \inf \int_{\Omega} F(x, \mathbf{u}_{n}, \mathbf{U}_{n}) dx \ge \lim_{n \to \infty} \inf \left(\int_{\Omega_{\varepsilon}} F(x, \mathbf{u}_{n}, \mathbf{U}) - C(x) dx + \int_{\Omega_{\varepsilon}} \nabla_{p} F(x, \mathbf{u}_{n}, \mathbf{U}) \cdot (\mathbf{U}_{n} - \mathbf{U}) dx + \int_{\Omega} C(x) dx \right) \ge \\
\ge \lim_{n \to \infty} \inf \int_{\Omega_{\varepsilon}} F(x, \mathbf{u}_{n}, \mathbf{U}) - C(x) dx + \lim_{n \to \infty} \inf \left(\int_{\Omega_{\varepsilon}} \nabla_{p} F(x, \mathbf{u}_{n}, \mathbf{U}) \cdot (\mathbf{u}_{n} - \mathbf{U}) dx \right) + \int_{\Omega} C(x) dx.$$

The second integral actually has a limit, as $\mathbf{U}_n \to \mathbf{U}$ in Ω_{ε} , so \mathbf{U} is bounded and $\nabla_p F(x, \mathbf{u}_n, \mathbf{U}_n) \in \mathcal{L}_{\infty}(\Omega_{\varepsilon})$, because $\mathbf{u}_n \to \mathbf{u}$ on Ω_{ε} and $\nabla_p F(x, \mathbf{u}_n, \mathbf{U})$ is continuous in \mathbf{u}_n from Caratheodory. As the first integral is nonnegative, we can use Fatou to estimate from below. But since $F(x, \cdot, \mathbf{p})$ is continuous from Caratheodory property and $\mathbf{u}_n \to \mathbf{u}$ on Ω_{ε} , the integrand has a limit and it actually holds:

$$\liminf_{n\to\infty} \int_{\Omega} F(x,\mathbf{u}_n,\mathbf{U}_n) \, \mathrm{d}x \geq \int_{\Omega_{\varepsilon}} F(x,\mathbf{u},\mathbf{U}) - C(x) \, \mathrm{d}x + \int_{\Omega} C(x) \, \mathrm{d}x = \int_{\Omega_{\varepsilon}} F(x,\mathbf{u},\mathbf{U}) \, \mathrm{d}x + \int_{\Omega/\Omega_{\varepsilon}} C(x) \, \mathrm{d}x,$$

and by taking the limit $\varepsilon \to \varepsilon^+$ and using the monotone convergence theorem we actually have

$$\liminf_{n\to\infty} \int_{\Omega} F(x, \mathbf{u}_n, \mathbf{U}_n) \, \mathrm{d}x \ge \int_{\Omega} F(x, \mathbf{u}, \mathbf{U}) \, \mathrm{d}x.$$

Remark. • if $U_n \to U$ strongly $\Rightarrow u_n \to u, U_n \to U$ a.e. (up to a subsequence) and the claim follows from the Fatou lemma. ³³

• norm is weakly lower semicontinuous:

$$\nabla u_n \rightharpoonup \nabla u \operatorname{in} L_p(\Omega) \Rightarrow \int_{\Omega} |\nabla u|^p dx \le \liminf_{n \to \infty} \int_{\Omega} |\nabla u_n|^p dx.$$

Theorem 26 (Existence of a minimizer). Let $d \in \mathbb{N}, \Omega \in C^{0,1}, r \in (1, \infty), u_0 \in W^{1,r}(\Omega)$, denote $X = u_0 + W_0^{1,r}(\Omega)$. Let $F : \Omega \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}$ be Caratheodory with the coercivity condition: $\exists C > 0, h \in L_1(\Omega)$ s.t.:

$$\forall \ a.a. \ x \in \Omega, \forall (z, \mathbf{p}) \in \mathbb{R} \times \mathbb{R}^d : F(x, z, \mathbf{p}) \ge C |\mathbf{p}|^r - h.$$

Let moreover F be convex in the last variable, i.e., let $\mathbf{p} \mapsto F(x, z, \mathbf{p})$ be convex \forall a.a. $x \in \Omega, \forall z \in \mathbb{R}$. Then there exists $u \in X$ that minimizes I on X, i.e., $\operatorname{tr} u = \operatorname{tr} u_0$ on $\partial \Omega$ and

$$\forall v \in X : I(u) \leq I(v)$$
.

Proof. First of all, let us show

$$\Lambda \coloneqq \inf_{u \in X} I(u) = \inf_{u \in X} \int_{\Omega} F(x, u, \nabla u) \, \mathrm{d}x,$$

is bounded from below. Coercivity states

$$F(x, u, \nabla u) \ge C |\nabla u|^r - h(x),$$

so

$$\int_{\Omega} F(x, u, \nabla u) dx \ge \int_{\Omega} C |\nabla u|^r - h(x) dx \ge C \|\nabla u\|_{\mathbf{L}_{r}(\Omega)}^r - \|h\|_{\mathbf{L}_{1}(\Omega)} \ge - \|h\|_{\mathbf{L}_{1}(\Omega)},$$

and since $||h||_{L_1(\Omega)}$ is of course bounded, this means $\Lambda > -\infty$. Next, we show there exists a minimizing sequence $\{u_n\} \subset X$, *i.e.*, a sequence *s.t.*

$$\lim_{n\to\infty}I(u_n)=\Lambda.$$

³³For Fatou, we need nonnegativity of the integrand, but that can be again met from the assumptions $F - c_2 \ge 0, F - c_2 \in L_1(\Omega)$

But that is easy - from the definition of infimum, $\forall n \in \mathbb{N} \exists u_n \in X$ such that

$$I(u_n) \le \Lambda + \frac{1}{n},$$

and so we obtain our sequence $\{u_n\} \subset X$ by just organizing those functions in a sequence. Now, also from the property of the infimum we may write

$$I(u_n) = \int_{\Omega} F(x, u_n, \nabla u_n) dx \le \Lambda + 1,$$

and so upon using coercivity and estimating the integral from below we may write

$$\int_{\Omega} F(x, u_n, \nabla u_n) \, \mathrm{d}x \ge \int_{\Omega} C |\nabla u_n|^r - h \, \mathrm{d}x \ge C \|\nabla u_n\|_{\mathrm{L}_r(\Omega)}^r - \|h\|_{\mathrm{L}_1(\Omega)},$$

and so

$$\|\nabla u_n\|_{\mathcal{L}_r(\Omega)}^r \le \frac{1}{C} (\Lambda + 1 + \|h\|_{\mathcal{L}_1(\Omega)}), i.e., \|\nabla u_n\|_{\mathcal{L}_r(\Omega)} \le C_1$$

Realize also that

$$\|\nabla u_n\|_{\mathcal{L}_r(\Omega)} = \|\nabla(u_n - u_0) + \nabla u_0\|_{\mathcal{L}_r(\Omega)} \ge \|\nabla(u_n - u_0)\|_{\mathcal{L}_r(\Omega)} - \|\nabla u_0\|_{\mathcal{L}_r(\Omega)} \ge C_p \|u_n - u_0\|_{\mathcal{W}_0^{1,r}(\Omega)} - \|\nabla u_0\|_{\mathcal{L}_r(\Omega)},$$
meaning

$$||u_n - u_0||_{W_0^{1,r}(\Omega)} \le \frac{1}{C_p} (||\nabla u_n||_{L_r(\Omega)} + ||\nabla u_0||_{L_r(\Omega)}) \le \frac{1}{C_p} (C_1 + ||\nabla u_0||_{L_r(\Omega)}) = C_2,$$

where we used Poincare and the fact $\{u_n\} \subset X$, so $\operatorname{tr} v_n = \operatorname{tr} u_0$. Finally, using

$$||u_n - u_0||_{W_0^{1,r}(\Omega)} \ge ||u_n||_{W^{1,r}(\Omega)} - ||u_0||_{W^{1,r}(\Omega)}$$

we have obtained

$$||u_n||_{W^{1,r}(\Omega)} \le C_2 + ||u_0||_{W^{1,r}(\Omega)} = C_3,$$

which is an uniform bound of the functions from the sequence. $\{u_n\}$ is a bounded sequence in a reflexive space³⁴, so

$$u_n \rightharpoonup u$$
, in $W^{1,r}(\Omega)$.

in particular

$$\nabla u_n \rightharpoonup \nabla u \operatorname{in} \mathcal{L}_r(\Omega)$$
,

and also

$$u_n \to u$$
, in $L_r(\Omega)$.

Finally, this means

$$\Lambda = \lim_{n \to \infty} \int_{\Omega} F(x, u_n, \nabla u_n) \, \mathrm{d}x \ge \liminf_{n \to \infty} \int_{\Omega} F(x, u_n, \nabla u_n) \, \mathrm{d}x \ge \int_{\Omega} F(x, u, \nabla u) \, \mathrm{d}x \ge \Lambda,$$

where we used the weak lower sequential semicontinuity of I and the fact $u \in X$, so $I(u) \ge \Lambda$. But the above manipulation shows that in fact all the inequalities must be equalities, and thus

$$I(u) = \int_{\Omega} F(x, u, \nabla u) dx = \Lambda,$$

i.e., u is a minimizer.

 $[\]overline{\ \ }^{34}X$ is the space $X = u_0 + W_0^{1,r}(\Omega)$, and since $W_0^{1,r}(\Omega)$ is a closed subspace of $W^{1,r}(\Omega)$, the space X is actually a factorspace and its reflexivity is implied by the reflexivity of $W^{1,r}(\Omega)$.

6 Evolutionary equations

6.1 Embedding theorems for Sobolev-Bochner spaces

In the whole section, we take X as a Banach space and T > 0. Let us recall just a few definitions

Definition 13 (Simple function, strong measurability, Bochner integral). We call $s: I \to X$ a simple function, provided $\exists n \in \mathbb{N}$ such that $\exists \{x_j\}_{j=1}^n, \exists \{E_j\}_{j=1}^n \subset I$ that are pairwise disjoint and $\lambda_1(\bigcup_{j=1}^n E_j) < \infty$ such that

$$\forall t \in I : s(t) = \sum_{j=1}^{n} x_j \chi_{E_j}(t).$$

For a simple function s we define its Bochner integral over I as

$$\int_{I} s(t) dt = \sum_{j=1}^{n} x_{j} \lambda_{1}(E_{j}).$$

A function $f: I \to X$ is called (strongly) measurable, provided $\exists \{s_n\}_{n \in \mathbb{N}}$ simple functions s.t.

$$s_n(t) \to f(t)$$
, in $X, \lambda_1 - a.a.t \in I$,

meaning

$$\lim_{n\to\infty} \|s_n(t) - f(t)\|_X = 0, \forall \lambda_1 - a.a.t \in I.$$

We say a strongly measurable function $f: I \to X$ is Bochner integrable, provided $\exists \{s_n\}_{n \in \mathbb{N}}$ simple functions s.t. $s_n(t) \to f(t)$ in X and $\lambda - 1$ a.e. in I and also

$$\lim_{n\to\infty} \int_I \|s_n(t) - f(t)\|_X \,\mathrm{d}\lambda_1 = 0.$$

Then we define the Bochner integral of f over I as

$$\int_{I} f(t) dt = \lim_{n \to \infty} s_n(t) dt.$$

Definition 14 (Lebesgue-Bochner & Sobolev-Bochner spaces). We say a function $g \in L_1((0,T);X)_{loc}$ is the weak (time) derivative of the function $u \in L_1((0,T);X)$, provided it holds

$$\forall \varphi \in \mathcal{D}(I) : \int_{I} g(t)\varphi(t) dt = -\int_{I} u(t)f'(t).$$

We write $g = \partial_t u$. For $p \in [1, \infty)$ we define

$$L_p((0,T);X) = \{f: I \to X \text{ strongly measurable } | \int_I ||f(t)||_X^p < \infty \},$$

and for $p = \infty$

$$L_{\infty}\Big((0,T);X\Big) = \left\{f: I \to X \text{ strongly measurable } | \underset{t \in I}{\operatorname{ess sup}} \|f(t)\|_{X} < \infty \right\},\,$$

together with the norms

$$||f||_{\mathcal{L}_{p}((0,T);X)} = \left(\int_{T} ||f(t)||_{X}^{p} dt\right)^{\frac{1}{p}}, p \in [1, \infty)$$

$$||f||_{\mathcal{L}_{\infty}((O,T);X)} = \operatorname{ess\,sup}_{t \in I} ||f(t)||_{X}.$$

Next, we define the set

$$\mathbf{W}^{1,p}\Big((0,T);X\Big) = \Big\{f: I \to X \text{ strongly measurable} \, \big| \, f \in \mathcal{L}_p\Big((0,T);X\Big), \, \partial_t f \in \mathcal{L}_p\Big((0,T);X\Big) \Big\},$$

with the norms

$$||f||_{\mathbf{W}^{1,p}((0,T);X)} = \left(||u||_{\mathbf{L}_{p}((0,T);X)}^{p} + ||\partial_{t}u||_{\mathbf{L}_{p}((0,T);X)}^{p}\right)^{\frac{1}{p}}, p \in [1,\infty)$$

$$||f||_{\mathbf{W}^{1,\infty}((0,T);X)} = \operatorname{ess\,sup}_{t \in I} \left(||f||_{\mathbf{L}_{\infty}((0,T);X)} + ||f||_{\mathbf{L}_{\infty}((0,T);X)}\right), p = \infty.$$

Definition 15 (Continuous functions, strong derivatives). The standard definition of limits in normed spaces work of course: function $f: I \to X$ is said to be continuous on I provided $\forall \{t_n\}_{n \in \mathbb{N}}$ such that $t_n \to t$ in I it holds $f(t_n) \to f(t)$ in X. We say f has a derivative at $t_0 \in I$ denoted $f'(t_0) \in X$ if

$$f'(t_0) = \lim_{h \to 0^+} \frac{f(t_0 + h) - f(t_0)}{h}$$

the limit exists. The spaces $C^{k}(I;X), C^{\infty}(I;X), \mathcal{D}(I;X)$ are then defined as expected.

Lemma 13 (Lebesgue theorem for vector valued functions). Let $\{f_n\}_{n\in\mathbb{N}} \subset L_1((0,T);X)$ such that $f_n(t) \to f(t)$ in X for $a.a.t \in I$. Then $f \in L_1((0,T);X)$ and it holds

$$\lim_{n\to\infty}\int_I f_n(t)\,\mathrm{d}t = \int_I f(t)\,\mathrm{d}t.$$

Proof. No proof.

Lemma 14. Let $p \in [1, \infty)$. Then

• The set

$$\left\{u:I\to X|u(t)=\sum_{j=1}^{N}\varphi_{j}(t)x_{j},N\in\mathbb{N},\varphi_{j}\in\mathcal{D}\left(I\right),x_{j}\in X\right\},$$

is dense in $L_p((0,T);X)$. In particular, $\mathcal{D}((0,T);X)$ is dense in $L_p((0,T);X)$.

• Let $\omega \in \mathcal{D}(\mathbb{R})$ be a regularization kernel, and extend $u \in L_p((0,T);X)$ by zero outside of (0,T). Then $u \star \omega_{\varepsilon} \to u$ as $\varepsilon \to 0^+$, in $L_p((0,T);X)$ and a.e. in (0,T).

Theorem 27. Let X be a Banach space, $p \in [1, \infty]$. Then

$$W^{1,p}(I;X) \hookrightarrow C^0(I;X)\,.$$

Lemma 15 (Arzela-Ascoli). Let X, Y be Banach spaces, $X \subset Y$. Then

$$C^1([0,T];X) \subset C([0,T];Y).$$

Lemma 16 (Ehrling). Let V_1, V_2, V_3 be Banach spaces s.t. $V_1 \subset V_2 \subset V_3$. Then

$$\forall \varepsilon > 0 \exists C > 0 : \forall u \in V_1 : \|u\|_{V_2} \le \varepsilon \|u\|_{V_1} + C \|u\|_{V_3}.$$

Proof. By contradicition, assume

$$\exists \varepsilon > 0 \ s.t. \ \forall n \in N \ \exists u_n \in V_1 : \|u_n\|_{V_2} > \varepsilon \|u_n\|_{V_1} + n \|u_n\|_{V_2}.$$

WLOG we can assume $\{u_n\} \subset S_{V_2}(0,1)$: truly, the inequality is 1-homogenous and holds if $u_n = 0$. In particular we see $\|u_n\|_{V_3} < \frac{1}{n}$, so $u_n \to 0$ in V_3 . Moreover, $\{u_n\}$ is bounded in V_1 and since $V_1 \subset V_2$ there exists $\{u_{n_k}\} \subset \{u_n\}$ s.t.: $u_{n_k} \to u$ in V_2 strongly. Since $\{u_n\} \subset S_{V_2}(0,1)$, also $\|u\|_{V_2} = 1$. Finally, taking the limit passage yields $0 \ge \|u\|_{V_3}$ and so u = 0 in V_3 and also in V_2 . But that is a contradiction with the fact $\{u_n\} \subset S_{V_2}(0,1)$.

Theorem 28 (Aubin-Lions). Let V_1, V_2, V_3 be Banach spaces s.t. $V_1 \subset V_2 \subset V_3, p \in [1, \infty)$. Then the space

$$\mathcal{U} = \{ u \in L_p((0,T); V_1), \partial_t u \in L_1((0,T); V_3) \},$$

with the norm

$$||u|| = ||u||_{L_n((0,T);V_1)} + ||\partial_t u||_{L_1((0,T);V_3)},$$

satisfies

$$\mathcal{U} \subset L_p((0,T);V_2).$$

Proof. Strategy: I want to fix $M \subset \mathcal{U}$ bounded and show that it is precompact in $L_p((0,T); V_2)$. That will be done in the following way:

- 1. Mollify M by convolution
- 2. use Arzela-Ascoli
- 3. show compactness in $L_p((0,T); V_3)$
- 4. apply Ehrling lemma and show compactness in $L_p((0,T); V_2)$.

Fix $M \subset \mathcal{U}$ bounded. Then $\exists C^* > 0 : \forall u \in M : ||u||| \ge C^*$. Next, take

$$\varphi : \mathbb{R} \to [0, \infty), \varphi \in C^{\infty}(\mathbb{R}), \operatorname{supp} \varphi \subset (-1, 0), \int_{\mathbb{R}} \varphi \, \mathrm{d}x = 1,$$

a regularization kernel, then $\forall \delta > 0$ define $\varphi_{\delta}(t) := \frac{1}{\delta} \varphi(\frac{t}{\delta})$.

Now, extend functions from M to (0,2T) in the following way:

$$\forall u \in M : \tilde{u}(t) \coloneqq \begin{cases} u(t), & t \in (0,T) \\ u(2T-t), & t \in (T,2T) \end{cases}.$$

Now mollify: for $\delta > 0, \delta < T$ fixed define

$$M_{\delta} = \{ (\tilde{u} \star \varphi_{\delta}) \Big|_{(0,T)} | u \in M \}.$$

From the properties of regularization it follows $M_{\delta} \subset C^1([0,T];V_1) \subset C([0,T];V_2) \subset L_p((0,T);V_2)$.

Now estimate the distance of M and M_{δ} in $L_p((0,T); V_3)$: for

$$u \in M, t \in (0,T): \tilde{u}(t) - \tilde{u}_{\delta}(t) = \tilde{u}(t) - \int_{-\delta}^{0} \tilde{u}(t-s)\varphi_{\delta}(s) \, \mathrm{d}s = \int_{-\delta}^{0} (\tilde{u}(t) - \tilde{u}(t-s))\varphi_{\delta}(s) \, \mathrm{d}s = \int_{-\delta}^{0} (\tilde{u}(t) - \tilde{u}(t-s)) \frac{\mathrm{d}}{\mathrm{d}s} \int_{-\delta}^{s-\delta} \mathrm{d}s \, \mathrm{d}s$$
and this is equal to

$$(\tilde{u}(t) - \tilde{u}(t-s)) \int_{-\delta}^{s} \varphi_{\delta}(\sigma) d\sigma \Big|_{s--\delta}^{0} - \int_{-\delta}^{0} \frac{d}{ds} (\tilde{u}(t) - \tilde{u}(t-s)) \int_{-\delta}^{s} \varphi_{\delta}(\sigma) d\sigma ds,$$

since the first bracket is 0 and by denoting the first term in the second integrand by $\tilde{u'}(t-s)$ this becomes (using Fubini)

$$= -\int_{-\delta}^{0} \int_{\sigma}^{0} \tilde{u}'(t-s) \,\mathrm{d}s \,\varphi_{\sigma}(\sigma) \,\mathrm{d}\sigma,$$

and we see

$$\|\tilde{u}(t) - \tilde{u_{\delta}}(t)\|_{V_3} \leq \int_{-\delta}^0 \int_{\sigma}^0 \|\tilde{u'}(t-s)\|_{V_3} \,\mathrm{d}s \,\varphi_{\sigma}(\sigma) \,\mathrm{d}\sigma.$$

 $L_1((0,T);V_3)$ estimate:

$$\int_0^T \|u(t) - u_\delta(t)\|_{V_3} \, \mathrm{d}t \leq \int_0^T \int_{-\delta}^0 \int_\sigma^0 \left\| u'(\tilde{t-s}) \right\|_{V_3} \, \mathrm{d}s \, \varphi_\delta(\sigma) \, \mathrm{d}\sigma \, \mathrm{d}t \leq 2\delta \|u'\|_{\mathrm{L}_1((0,T);V_3)} \leq 2\delta C^*$$

 $L_{\infty}((0,T);V_3)$ estimate:

$$||u - u_{\delta}||_{L_{\infty}((O,T);V_3)} \le 2||u'||_{L_{1}((0,T);V_3)} \le 2C^*$$

It remains to show $M_{\delta} \subset L_p((0,T); V_2)$:

$$\|u - u_{\delta}\|_{\mathcal{L}_{\mathcal{D}}((0,T);V_3)} \le \|u - u_{\delta}\|_{\mathcal{L}_{\mathcal{D}}((0,T);V_3)}^{1/p} \|u - u_{\delta}\|_{\mathcal{L}_{\infty}((0,T);V_3)}^{1-1/p} \le 2C^* \delta^{1/p}$$

Finally, from Ehrling we have

$$\forall \mu > 0 \exists C_{\mu} > 0 : \forall u \in \mathcal{U} : \|u - u_{\delta}\|_{\mathbf{L}_{p}((0,T);V_{2})} \leq \mu \|u - u_{\delta}\|_{\mathbf{L}_{p}((0,T);V_{1})} + C_{\mu} \|u - u_{\delta}\|_{\mathbf{L}_{p}((0,T);V_{3})}.$$

This means

$$\forall u \in M : \|u - u_{\delta}\|_{\mathcal{L}_{p}((0,T);V_{2})} \leq C^{*} + C\mu 2C^{*}\delta^{1/p}.$$

Now fix $\varepsilon > 0$ and find

$$\mu > 0: \mu C^* < \frac{\varepsilon}{2}, \delta > 0, C_{\mu} 2C^* \delta^{1/p} < \frac{\varepsilon}{2} \Rightarrow \forall u \in M: \|u - u_{\delta}\|_{\mathcal{L}_{p}((0,T);V_2)} < \varepsilon.$$

This means $\exists \{w_k\}_{k=1}^N \subset M : \{(w_k)_\delta\}_{k=1}^n \text{ is } \varepsilon\text{-net in } M \text{ in } L_p((0,T); V_2).$ If we now fix $u \in M$, then

$$\exists K \in \{1, \dots, N\} : \|u_{\delta - (w_K)_{\delta}}\|_{L_p((0,T);V_2)} < \varepsilon.$$

Remark. The pair $(\mathcal{U}, ||| \cdot |||)$ is a Banach space.

6.2 Nonlinear parabolic equations

We will be dealing with the following problem:

$$\partial_t u - \nabla \cdot \mathbf{a}(x, u, \nabla u) + a_0(x, u, \nabla u) = f \text{ in } (0, T) \times \Omega, \tag{5}$$

$$u = u_0, \text{ on } \{0\} \times \Omega, \tag{6}$$

$$u = 0$$
, on $(0, T) \times \partial \Omega$. (7)

The unknown is the function $u(t,x):(0,T)\times\Omega\to\mathbb{R}$, and we are given

- $\Omega \in \mathbb{C}^{0,1}, T > 0, Q_T = (0, T) \times \Omega,$
- $\mathbf{a}: \Omega \times \mathbb{R} \times \mathbb{R}^d \mapsto \mathbb{R}^d, a_i: \Omega \times \mathbb{R} \times \mathbb{R}^d \mapsto \mathbb{R}$ are Caratheodory in $x \in \Omega$ and in $(z, p) \in \mathbb{R} \times \mathbb{R}^d$, with the following growth condition: $\exists C > 0, \exists r \in (1, \infty) \ s.t.$

$$\forall \ a.a. \ x \in \Omega, \ \forall (z, \mathbf{p}) \in \mathbb{R}^{d+1} : |a_i(x, z, \mathbf{p})| \le C(1 + |z|^{r-1} + |\mathbf{p}|^{r-1}),$$

• and also with the coercivity condition: $\exists C_1, C_2 > 0, \exists q \in (1, \max(2, r))$:

$$\forall a.a. x \in \Omega, \forall (z, \mathbf{p}) \in \mathbb{R}^{d+1} : \mathbf{a}(x, z, \mathbf{p}) \cdot \mathbf{p} + a_0(x, z, \mathbf{p})z \ge C_1 |\mathbf{p}|^r - C_2 (1 + |z|^q),$$

• $f:(0,T)\times\Omega\to\mathbb{R}, u_0:\Omega\to\mathbb{R}$ (and will also be in some Banach spaces)

Theorem 29 (Existence and uniqueness). Let $\Omega \in C^{0,1}$, and let $\{a_i\}_{i=0}^d$ satisfy the above growth conditions and coercivity and let them moreover be monotone. Denote

$$V = W_0^{1,r}(\Omega) \cap L_2(\Omega).$$

Then $\forall f \in L_r \cdot ((0,T); V^*)$, $\forall u_0 \in L_2(\Omega)$ exists a solution $u \in L_r((0,T); V)$ s.t. $\partial_t u \in L_r \cdot ((0,T); V^*)$, $u \in C([0,T]; L_2(\Omega))$, $u(0) = u_0$ and moreover

$$\forall \ a.e. \ t \in (0,T), \forall \varphi \in V :< \partial_t u, \varphi > + \int_{\Omega} \mathbf{a}(x,u,\nabla u) \cdot \nabla \varphi + a_0(x,u,\nabla u) \varphi \, \mathrm{d}x = < f, \varphi > .$$

Finally, the solution is unique.

Remark. • the requirement $V = W_0^{1,r}(\Omega) \cap L_2(\Omega)$ becomes redundent whenever $r^* = \frac{rd}{d-r} > 2$,

- recall that $\left(\mathrm{L_r}((0,T);V)\right)^* = \mathrm{L_{r'}}((0,T);V^*),$
- on V we can assume e.g. $||u||_{V} = ||u||_{L_{2}(\Omega)} + ||u||_{W_{0}^{1,r}(\Omega)}$.

Proof. The strategy is the following

- 1. approximate: either using Galerkin or using the Rothe method
- 2. a-priori estimates
- 3. convergences
- limit passage
- 5. identification of the limits

Rothe method:] Fix $m \in \mathbb{N}$ and divide the time interval (0,T) into subintervals of equal length: denote $h = \frac{T}{m}, t_0 = 0, t_m = T, t_k = kh, k \in 0, ..., m$. The goal is to solve a stationary variant of the problem on each subinterval $(t_k, t_{k+1}]$, approximate the time derivative using difference scheme and then pass to the (certain) limit $m \to \infty$.

Denote the (Bochner integral) mean

$$f_k = \frac{1}{h} \int_{t_k}^{t_{k+1}} f(t) \, \mathrm{d}t.$$

Realize that since $f \in L_{r'}((0,T);V^*)$, we have constructed $f_k \in V^*$, *i.e.*, time independent. For our fixed $m \in \mathbb{N}$ we will denote $u_m(t)$ the approximate solution on the discretization of I. Set $u_m(t_0 = 0) = u_0$, and $\forall k \in \{0, ..., m\}$ we will be looking for the solution $u_m(t_{k+1})$ of the following stationary problem on $(t_k, t_{k+1}]$:

$$\int_{\Omega} \frac{u_m(t_{k+1}) - u_m(t_k)}{h} \varphi \, \mathrm{d}x + \int_{\Omega} \mathbf{a}(x, u_m(t_{k+1}), \nabla u_m(t_{k+1})) \cdot \nabla \varphi + a_0(x, u_m(t_{k+1}), \nabla u_m(t_{k+1})) \varphi \, \mathrm{d}x = \langle f_k, \varphi \rangle.$$

The sought solution should lie in $V = W_0^{1,r}(\Omega) \cap L_2(\Omega)$, which we can check with following apriori estimate derived under. Realize that this way, $u_m(t_{k+1})$ is a stationary solution that is constant in time on $(t_k, t_{k+1}]$.

It is a question whether the solution $u_m(t_{k+1}) \in V$ for the above steady problem exists or not; since we have growth, monotonocity, coercivity and regularity of the data and the boundary, we will assume without a proof that the solution exists - it could in theory be proven using the tools from the application of monotone operator theory on nonlinear elliptic equations. We will not assume the solution to be unique however.

A-priori and uniform estimates As usual test the weak formulation with the solution itself, i.e., test with $u_m(t_{k+1}) \in V$.

$$\int_{\Omega} \frac{|u_{m}(t_{k+1})|^{2} - u_{m}(t_{k+1})u_{m}(t_{k+1})}{h} dx + \int_{\Omega} \mathbf{a}(x, u_{m}(t_{k+1}), \nabla u_{m}(t_{k+1})) \cdot \nabla u_{m}(t_{k+1}) + a_{0}(x, u_{m}(t_{k+1}), \nabla u_{m}(t_{k+1}))u_{m}(t_{k+1}) dx = \langle f_{k}, u_{m}(t_{k+1}) \rangle,$$

use the coercivity conditions and Poincare (recall $V = W_0^{1,r}(\Omega) \cap L_2(\Omega)$)

$$\begin{split} & \int_{\Omega} \mathbf{a}(x, u_{m}(t_{k+1}), \nabla u_{m}(t_{k+1})) \cdot \nabla u_{m}(t_{k+1}) + a_{i}(x, u_{m}(t_{k+1}), \nabla u_{m}(t_{k+1})) u_{m}(t_{k+1}) \, \mathrm{d}x \geq \\ & \geq \int_{\Omega} C_{1} |\nabla u_{m}(t_{k+1})|^{r} - C_{2} \Big(1 + |u_{m}(t_{k+1})|^{q} \Big) \, \mathrm{d}x = C_{1} ||\nabla u_{m}(t_{k+1})||_{\mathbf{L}_{r}(\Omega)}^{r} - C_{2} \Big(\lambda(\Omega) + ||u_{m}(t_{k+1})||_{\mathbf{L}_{q}(\Omega)}^{q} \Big) \geq \\ & \geq C_{1} ||\nabla u_{m}(t_{k+1})||_{\mathbf{L}_{r}(\Omega)}^{r} - C_{2} \Big(1 + \lambda(\Omega) + ||u_{m}(t_{k+1})||_{\mathbf{L}_{\max(2,r)}(\Omega)}^{\max(2,r)} \Big). \end{split}$$

where we used $q < \max(2, r)$, so $L_{\max(2, r)}(\Omega) \hookrightarrow L_q(\Omega)$. The RHS can be estimated as

$$\langle f_{k}, u_{m}(t_{k+1}) \rangle \leq \|f_{k}\|_{V^{*}} \|u_{m}(t_{k+1})\|_{V^{*}} = \|f_{k}\|_{V^{*}} \left(\|u_{m}(t_{k+1})\|_{L_{2}(\Omega)} + \|u_{m}(t_{k+1})\|_{W_{0}^{1,r}(\Omega)} \right) \leq C \left(\|f_{k}\|_{V^{*}}^{2} + \|f_{k}\|_{V^{*}}^{r'} \right) + \varepsilon \left(\|u_{m}(t_{k+1})\|_{L_{2}(\Omega)}^{2} + \|u_{m}(t_{k+1})\|_{W_{0}^{1,r}(\Omega)}^{r} \right).$$

Using these, the apriori estimates become

$$\int_{\Omega} u_m(t_{k+1})^2 - u_m(t_{k+1}) u_m(t_k) \, \mathrm{d}x + h \Big(C_1 \| \nabla u_m(t_{k+1}) \|_{\mathrm{L}_r(\Omega)}^r - C_2 \Big(1 + \lambda(\Omega) + \| u_m(t_{k+1}) \|_{\mathrm{L}_{\max(2,r)}(\Omega)}^{\max(2,r)} \Big) \Big) \leq Ch \Big(\| f_k \|_{V^*}^2 + \| f_k \|_{V^*}^{r'} \Big) + \varepsilon h \Big(\| u_m(t_{k+1}) \|_{\mathrm{L}_2(\Omega)}^2 + \| u_m(t_{k+1}) \|_{\mathrm{W}_0^{1,r}(\Omega)}^r \Big),$$

and when choosing $\varepsilon > 0$ and renaming all the constants

$$\int_{\Omega} u_m(t_{k+1})^2 - u_m(t_{k+1}) u_m(t_k) \, \mathrm{d}x + Ch\Big(\|u_m(t_{k+1})\|_{\mathrm{W}_0^{1,r}(\Omega)}^r \Big) \leq Ch\Big(\|f_k\|_{V^*}^2 + \|f_k\|_{V^*}^{r'} + \|u_m(t_{k+1})\|_{\mathrm{L}_2(\Omega)}^2 \Big)$$

Notice that (completing the square):

$$\int_{\Omega} u_m(t_{k+1})^2 - u_m(t_{k+1}) u_m(t_k) dx = \int_{\Omega} \frac{1}{2} u_m(t_{k+1})^2 + \frac{1}{2} (u_m(t_{k+1}) - u_m(t_k))^2 - \frac{1}{2} u_m(t_k)^2 dx,$$

so when we sum these terms from k = 0 to some j < m we see that a lot of things subtract in fact:

$$\sum_{k=0}^{j-1} \int_{\Omega} u_m(t_{k+1})^2 - u_m(t_{k+1}) u_m(t_k) \, \mathrm{d}x = \frac{1}{2} \left(\left\| u_m(t_j) \right\|_{\mathrm{L}_2(\Omega)}^2 - \left\| u_0 \right\|_{\mathrm{L}_2(\Omega)}^2 + \sum_{k=0}^{j-1} \left\| u_m(t_{k+1}) - u_m(t_k) \right\|_{\mathrm{L}_2(\Omega)}^2 \right).$$

So for j < m we can write the a-priori estimate as (we of course sum all the weak formulations)

$$||u_{m}(t_{j})||_{L_{2}(\Omega)}^{2} + \sum_{k=0}^{j-1} \left(||u_{m}(t_{k+1}) - u_{m}(t_{k})||_{L_{2}(\Omega)}^{2} + C_{1}h||u_{m}(t_{k+1})||_{W_{0}^{1,r}(\Omega)}^{r} \right) \leq C \left(||u_{0}||_{L_{2}(\Omega)}^{2} + h \sum_{k=0}^{j-1} \left(||f_{k}||_{V^{*}}^{2} + ||f_{k}||_{V^{*}}^{r'} + ||u_{m}(t_{k+1})||_{L_{2}(\Omega)}^{2} \right) \right).$$

It remains to notice $u_m(t_{k+1})$ is constant on $(t_k, t_{k+1}]$, so it actually holds

$$\sum_{k=0}^{j-1} h \|u_m(t_{k+1})\|_{W_0^{1,r}(\Omega)}^r = \sum_{k=0}^{j-1} \int_{t_k}^{t_{k+1}} \|u_m(t_{k+1})\|_{W_0^{1,r}(\Omega)}^r dt =$$

$$= \int_0^{t_j} \|u_m(t_{k+1})\|_{W_0^{1,r}(\Omega)}^r dt,$$

and also

$$\sum_{k=0}^{j-1} h \Big(\|f_k\|_{V^*}^2 + \|f_k\|_{V^*}^{r'} + \|u_m(t_{k+1})\|_{L_2(\Omega)}^2 \Big) = \int_0^{t_j} \|f_k\|_{V^*}^2 + \|f_k\|_{V^*}^{r'} + \|u_m(t_{k+1})\|_{L_2(\Omega)}^2 dt \le \\
\le \int_0^T \|f_k\|_{V^*}^2 + \|f_k\|_{V^*}^{r'} dt + \int_0^{t_j} \|u_m(t_{k+1})\|_{L_2(\Omega)}^2 dt,$$

so we can finally write the apriori estimates as

$$||u_{m}(t_{j})||_{L_{2}(\Omega)}^{2} + \sum_{k=0}^{j-1} ||u_{m}(t_{k+1}) - u_{m}(t_{k})||_{L_{2}(\Omega)}^{2} + C \int_{0}^{t_{j}} ||u_{m}(t_{k+1})||_{W_{0}^{1,r}(\Omega)}^{r} dt \le C \left(||u_{0}||_{L_{2}(\Omega)}^{2} + \int_{0}^{T} ||f_{k}||_{V^{*}}^{2} + ||f_{k}||_{V^{*}}^{r'} dt \right).$$

The RHS contains only data, so these are uniform estimates. Because are the summands are nonnegative and j < m was arbitrary, we conclude it must hold

$$||u_m||_{L_{\infty}((0,T);L_2(\Omega))} \le C,$$

 $||u_m||_{L_{\mathbf{r}}((0,T);W_0^{1,r}(\Omega))} \le C,$

and using the growth condition we also obtain

$$||a_i(\cdot, u_m, \nabla u_m)||_{\mathbf{L}_{\mathbf{r}'}((0,T);\mathbf{L}_{\mathbf{r}'}(\Omega))} \le C.$$

Limit passage Using the reflexivity of (some of) the spaces, we see that since the above sequences are uniformly bounded, it must be (we are not renaming the subsequences)

$$u_m \rightharpoonup u, \text{ in } L_r\Big((0,T); W_0^{1,r}(\Omega)\Big),$$

$$u_m \rightharpoonup^* u \text{ in } L_\infty\Big((0,T); L_2(\Omega)\Big),$$

$$a_i(\cdot, u_m, \nabla u_m) \rightharpoonup b_i, i \in \{0, \dots, d\} \text{ in } L_r \cdot \Big((0,T); L_{r'}(\Omega)\Big).$$

To be totally valid, we should check that the first convergencies are actually to the same function. We would like to obtain a sequence for the time derivative also. For that reason, let us do the following. On (t_k, t_{k+1}) , set

$$\tilde{u}_m(t) = u_m(t_k) + \frac{t - t_k}{h} (u_m(t_{k+1}) - u_m(t_k)),$$

and we immeditaly see

$$\partial_t \tilde{u}_m(t) = \frac{u_m(t_k) - u_m(t_{k+1})}{h}, t \in (t_k, t_{k+1}),$$

and from the previous esimates we also have

$$\|\tilde{u}_m\|_{L_{\infty}((0,T);L_2(\Omega))} \le C, \|\tilde{u}_m\|_{L_{\mathbf{r}}((0,T);W_0^{1,r}(\Omega))} \le C.$$

Rewriting the partial derivative from the weak formulation $u_m(t_{k+1})$ solves we obtain

$$\int_{\Omega} \partial_t \tilde{u}_m \varphi \, \mathrm{d}x = \langle f_k, \varphi \rangle - \int_{\Omega} \mathbf{a}(x, u_m(t_{k+1}), \nabla u_m(t_{k+1})) \cdot \varphi + a_0(x, u_m(t_{k+1}), \nabla u_m(t_{k+1})) \, \mathrm{d}x \leq$$

Let us now define $u^n(t) = u_k$ for $t \in (h(k-1), hk)$, then

$$\|u^n\|_{\mathrm{L}_{\infty}((O,T);\mathrm{L}_2(\Omega))}^2 + \|u^n\|_{\mathrm{L}_2((O,T);\mathrm{W}_0^{1,r}(Omega))}^2 < C(\mathrm{data}).$$

Now set $\tilde{u}^n(t) = u_{k-1} + \frac{t-t_{k-1}}{h}(u_k - u_{k-1})$ for $t \in (t_{k-1}, t_k)$ and

$$k \in \{1, \ldots, n\}.$$

It holds

$$\partial_t \tilde{u}^n(t) = \frac{u_k - u_{k-1}}{h}, t \in (t_{k-1}, t_k).$$

Using these quantities, we rewrite the quation to the form

$$\int_{\Omega} \partial_t \tilde{u}^n \varphi + a(\cdot, u^n, \nabla u^n) \cdot \nabla \varphi + a_0(\cdot, u^n, \nabla u^n) \varphi \, \mathrm{d}x = \langle f^n, \varphi \rangle,$$

where $f^n(t) := f_k$ in in

$$(t_{k-1}, t_k), k \in \{1, \ldots, \}.$$

We are now ready to use growth and apriori estimates:

$$\|a(\cdot, u^n, \nabla u^n)\|_{\mathbf{L}_{\omega}(Q_T)} + \|a_0(\cdot, u^n, \nabla u^n)\|_{\mathbf{L}_{\omega}(Q_T)} \le C(\text{data}).$$

For the norm of the time derivative:

$$\sup_{\varphi \in \operatorname{Sv}(0,1)} \langle \partial_t \tilde{u}^n(t), \varphi \rangle = \sup_{\varphi \in \operatorname{Sv}(0,1)} \langle f^n, \varphi \rangle - \int_{\Omega} \left(a(\cdot, u^n, \nabla u^n) \cdot \nabla f + a_0(\cdot, u^n, \nabla u^n) \varphi \right) dx,$$

at any $t \in (0,T)$. So using Holder:

$$\|\partial_t \tilde{u}^n(t)\|_{V^*} \le \|f^n\|_{V^*} + \|a(\cdot, u^n, \nabla u^n)\|_{L_{r_0}(\Omega)}(t) + \|a_0(\cdot, u^n, \nabla u^n)\|_{L_{r_0}(\Omega)}$$

and integrating

$$\int_{0}^{T} \|\partial_{t}\tilde{u}^{n}(t)\|_{V^{*}}^{r'} dt \leq C \left(\int_{0}^{T} \|f^{n}\|_{V^{*}}^{r'} + \|a(\cdot, u^{n}, \nabla u^{n})\|_{L_{r,\ell}(\Omega)}(t) + \|a_{0}(\cdot, u^{n}, \nabla u^{n})\|_{L_{r,\ell}(\Omega)}, dt \right) \leq TC(\operatorname{data})$$

7 Semigroup theory

We consider the equation

$$u' = Au, A \text{ is linear}$$

 $u(0) = u_0,$

where $u:[0,\infty)\to\mathbb{R}$. We know that for example if $Au=au,a\in\mathbb{R}$ then

$$u(t) = u_0 e^{at}.$$

If $\mathbf{u}:[0,\infty)\to\mathbb{R}^d$, $A\mathbf{u}=\mathbb{A}\mathbf{u}$, $\mathbb{A}\in\mathbb{R}^{d\times d}$, then

$$\mathbf{u}(t) = \exp(t\mathbb{A})\mathbf{u}_0, \exp(t\mathbb{A}) = \sum_{k=0}^{\infty} \frac{1}{k!} \mathbb{A}^k t^k.$$

This can be extended to $u:[0,\infty)\to X,X$ a banach space, $A\in\mathcal{L}(X)$, then

$$u(t) = \exp(tA)u_0$$

where the operator exponential is the same. This works well for unbounded operators, but suppose now

$$X = L_2(\Omega), Au = \Delta u.$$

We guess the solution should be

$$u(t) = \exp(\triangle t)u_0$$

but what is

$$\exp(\triangle t)$$
?

Definition 16 (Linear operator and its domain). Let X be a Banach space over \mathbb{K} . Linear operator on X is a couple $(A, \mathcal{D}(A))$, where $\mathcal{D}(A)$ is a subspace of X and $A : \mathcal{D}(A) \to X$ is linear.

Definition 17. A family $\{S(T)\}_{t\geq 0} \subset \mathcal{L}(X)$ is called a semigroup if

- 1. S(0) = id
- 2. $\forall s, t \ge 0 : S(t)S(s) = S(t+s)$.

If moreover $\forall x \in X : S(t)x \to x$, as $t \to 0_+$, we call $\{S(t)\}$ a c_0 - semigroup (strongly continuous).

Remark. $\{s(t)\}_{t\in\mathbb{R}}$ with the two conditions is an Abelian group $(\{S(t)\}_{t\in\mathbb{R}}, \circ)$ with

$$(S(t))^{-1} = S(-t).$$
 (8)

Remark (X = Banach). In the following, X is always a Banach space.

Lemma 17. Let $\{S(t)\}_{t\geq 0}$ be a c_0 -semigroup in X. Then

- 1. $\exists M \ge 1, \omega \in \mathbb{R}, \forall t \ge 0 : ||S(t)||_{\mathcal{L}(X)} \le Me^{\omega t},$
- 2. $\forall x \in X, t \mapsto S(t)x \in C([0, \infty); X)$.

Proof. $1 \Rightarrow 2$. Fix $t > 0, x \in X$ compute

$$\lim_{h \to 0_+} \|S(t+h)x - S(t)x\|_X = \lim_{h \to 0_+} \|S(t)(S(h)x - x)\|_X \le \lim_{h \to 0_+} \|S(t)\|_{\mathcal{L}(X)} \|S(h)x - x\|_X \to 0.$$

now compute $\lim_{h\to 0_+} \|S(t-h)x - S(t)x\|_X = \lim_{h\to 0_+} \|S(t-h)(x - S(h)x)\|_X \le \|S(t-h)\|_{\mathcal{L}(X)} \|x - S(h)x\|_X \to 0.$

Definition 18 (Infinitesimal generator). A linear operator $(A, \mathcal{D}(A))$ is called a infinitesimal generator of the semigroup $\{S(t)\}_{t>0}$, if

$$\forall x \in \mathcal{D}(A) : Ax = \lim_{h \to 0_+} \frac{S(h)x - x}{h},$$

where

$$\mathcal{D}(A) = \left\{ x \in X \middle| \lim_{h \to 0_+} \frac{S(h)x - x}{x} \text{ exists in } X \right\},\,$$

Theorem 30. Let $(A, \mathcal{D}(A))$ be the infinitesimal generator of a c_0 -semigroup $\{S(t)\}_{t\geq 0}$ in X. Then

1.
$$x \in \mathcal{D}(A) \Rightarrow \forall t \ge 0 : S(t)x \in \mathcal{D}(A) \land AS(t)x = S(t)Ax = \frac{d}{dt}(S(t)x),$$

2.
$$x \in X \land t \ge 0 \Rightarrow x_t = \int_0^t S(s)x \, ds \in \mathcal{D}(A) \land A(x_t) = S(t)x - x$$
.

Proof. Fix $x \in \mathcal{D}(A), t \geq 0$. Calculate

$$\lim_{h \to 0_+} \frac{S(h)S(t)x - S(t)x}{h} = {}^{35}\lim_{h \to 0_+} S(t)\frac{S(h)x - x}{h} = S(t)Ax,$$

(convergence is in the norm of the Banach space X). This means $S(t)x \in \mathcal{D}(A) \wedge AS(t)x = S(t)Ax$, moreover, if t > 0:

$$\lim_{h \to 0_+} \frac{S(t-h)x - S(t)x}{-h} - S(t)Ax = \lim_{h \to 0_+} S(t-h) \left(\frac{x - S(h)x}{-h} - S(h)Ax \right),$$

estimate,

$$\left\| \lim_{h \to 0_{+}} \frac{S(t-h)x - S(t)x}{-h} - S(t)Ax \right\| = \left\| \lim_{h \to 0_{+}} S(t-h) \left(\frac{x - S(h)x}{-h} - S(h)Ax \right) \right\| =$$

$$= \lim_{h \to 0_{+}} \left\| \frac{S(t-h)x - S(t)x}{-h} - S(t)Ax = \lim_{h \to 0_{+}} S(t-h) \left(\frac{x - S(h)x}{-h} - S(h)Ax \right) \right\| \le$$

$$\le Me^{\omega(t-h)} \left\| \frac{x - S(h)x}{-h} - S(h)Ax \right\| \to Me^{\omega(t-h)} (Ax - Ax) = 0,$$

as S(t) is continuous and $S(0) = \mathrm{id}$. Clearly, $t \mapsto S(t)x$ is $C^1([0, \infty))$ and

$$\frac{\mathrm{d}}{\mathrm{d}t}(S(t)x) = S(t)S'(0)x = S(t)Ax.$$

To show the second part, compute

$$\lim_{h \to 0_+} \frac{1}{h} (S(h)x_t - x_t) = \lim_{h \to 0_+} \frac{1}{h} \left(\int_h^{t+h} S(s)x \, \mathrm{d}s - \int_0^t S(s)x \, \mathrm{d}s \right),$$

realize that

$$S(h)x_t = \int_0^t S(s+h)x \, \mathrm{d}s = \int_h^{t+h} S(s)x \, \mathrm{d}s,$$

 $^{^{35}}S(h)S(t) = S(h+t) = S(t+h) = S(t)S(h)$

so the previous computation continues as follows

$$= \lim_{h \to 0_+} \frac{1}{h} \left(\int_t^{t+h} S(s) x \, \mathrm{d}s - \int_0^h S(s) x \, \mathrm{d}s \right) = S(t) x - x \wedge x_t \in \mathcal{D}(A).$$

Definition 19 (Closed operator). We say that a linear operator $(A, \mathcal{D}(A))$ is closed if $\forall \{u_n\} \subset \mathcal{D}(A) : u_n \to u \land Au_n \to v$, for some $u, v \in X$, then it most hold

$$u \in \mathcal{D}(A) \wedge Au = v$$
.

This also means that $\{(x, Ax)|x \in \mathcal{D}(A)\}\subset X\times X$ is closed in $(X\times X, \|\cdot\|_1)$.

Example. Let $\Omega \in C^{1,1}, X = L_2(\Omega), \mathcal{D}(A) = W^{2,2}(\Omega) \cap W_0^{1,2}(\Omega), Au = \Delta u$. Then $(A, \mathcal{D}(A))$ is closed. Really, take $\{u_n\} \subset L_2(\Omega) : u_n \to u$ in $L_2(\Omega)$ for some $u \in L_2(\Omega)$. Suppose $Au_n \to v$ in $L_2(\Omega), v \in L_2(\Omega)$. Suppose the following equation: find

$$u_n s.t. - \Delta u_n = Au_n, u_n \text{ on } \partial \Omega.$$

From the regularity theory for elliptic problems, we know that $\|u_n\|_{W^{2,2}(\Omega)} \leq C \|Au_n\|_{L_2(\Omega)} \leq C$, so we can extract $u_{n_k} \rightharpoonup u$ in $W^{2,2}(\Omega)$. Realize moreover

$$\int_{\Omega} \Delta u_n \varphi \, \mathrm{d}x = \int_{\Omega} u_n \, \Delta \varphi \, \mathrm{d}x, \, \forall \varphi \in \mathcal{D}(\Omega),$$

and the limit of this is

$$\int_{\Omega} v \varphi \, \mathrm{d}x = \int_{\Omega} u \bigtriangleup \varphi \, \mathrm{d}x = \int_{\Omega} \bigtriangleup u \varphi \, \mathrm{d}x \,,$$

which means $\triangle u = v \ a.e.$ in Ω and that $u \in \mathcal{D}(A)$, Au = v.

Theorem 31. Let $(A, \mathcal{D}(A))$ be the infinitesimal generator of a c_0 -semigroup $\{S(t)\}_{t>0} \subset X$. Then

- 1. $\mathcal{D}(A)$ is dense in X,
- 2. $(A, \mathcal{D}(A) \text{ is closed.})$

Proof. Ad 1.:

$$\frac{1}{t}x_t = \frac{1}{t} \int_0^t S(s)x \, \mathrm{d}s \underbrace{\in \mathcal{D}(A)}_{\text{prev. thm}}, \frac{x_t}{t} \to x \, \mathrm{in} \, X,$$

Ad 2.: Take $\{x_n\} \subset \mathcal{D}(A): x_n \to x \text{ in } X, Ax \to v \text{ in } X$. Compute³⁶

$$\frac{(S(h) - \operatorname{id})x_n}{h} = \frac{1}{h} \int_0^h \frac{\mathrm{d}}{\mathrm{d}s} (S(s)x_n) \, \mathrm{d}s = \frac{1}{h} \int_0^h AS(s)x_n \, \mathrm{d}s =$$

$$= \frac{1}{h} \int_0^h S(s) \underbrace{Ax_n}_{\text{odd}}, \text{ so taking the limit yields } \frac{(S(h) - \operatorname{id})x}{h} = \frac{1}{h} \int_0^h S(s)v \, \mathrm{d}s \to v, \text{ as } h \to 0_+.$$

Altogether, $x \in \mathcal{D}(A)$, Ax = v.

 $^{^{36}}$ This "Newton-Leibniz formula" does not hold trivially, but doc. Kaplicky says it does; you have to realize that X is a Banach space and work with some functionals and Bochner integrals or whatever

Lemma 18. Let $(A, \mathcal{D}(A))$ be the infinitesimal generator of c_0 -semigroups $\{S(t)\}_{t\geq 0}, \{\tilde{S}(t)\}_{t\geq 0}$. Then

$$\{S(t)\}_{t\geq 0} = \{\tilde{S}(t)\}_{t>0}.$$

Proof. We want to show

$$\forall x \in X, \forall t \ge 0 : S(t)x = \tilde{S}(t)x.$$

Fix $x \in \mathcal{D}(A), t > 0$. Then $g(s) := S(s)\tilde{S}(t-x)x$ satisfies $g \in C^1([0,t];X), g'(s) = S'(s)\tilde{S}(t-s)x - S(s)\tilde{S}'(t-s)x = AS(s)\tilde{S}(t-s)x - S(s)A\tilde{S}(t-s)x = 0$, as A, S commute. This means g(0) = g(1) and from this it follows $S(t)x = \tilde{S}(t)x, \forall x \in \mathcal{D}(A)$. Since $\overline{\mathcal{D}(A)} = X, S$ continous $\Rightarrow S(t)x = \tilde{S}(t)x \forall x \in X$, and since $t \geq 0$ was arbitrary, we are done.

Definition 20 (Resolvent of a linear operator). Let $(A, \mathcal{D}(A))$ be a linear (possibly unbounded) operator on X. We define

1. resolvent set

$$\rho(A) = \left\{ \lambda \in \mathbb{K} | \lambda \operatorname{id} - A \operatorname{is invertible and} (\lambda \operatorname{id} - A)^{-1} \in \mathcal{L}(X) \right\},\,$$

2. resolvent operator $R(\lambda, A): X \to \mathcal{D}(A): R(\lambda, A) = (\lambda \mathrm{id} - A)^{-1}$, for $\lambda \in \rho(A)$.

Remark. If $(A, \mathcal{D}(A))$ is a closed linear operator: $\lambda \in \rho(A) \Leftrightarrow \lambda \mathrm{id} - A$ is a bijection of $\mathcal{D}(A)$ onto X.

Lemma 19. Let $(A, \mathcal{D}(A))$ be a linear operator on X. It holds

- 1. $\forall x \in X, \forall \lambda \in \rho(A) : AR(\lambda, A)x = \lambda R(\lambda, A)x x$
- 2. $\forall x \in \mathcal{D}(A), \forall \lambda \in \rho(A) : R(\lambda, A)Ax = \lambda R(\lambda, A)x x,$
- 3. $\forall \lambda, \eta \in \rho(A) : R(\lambda, A) R(\eta, A) = (\eta \lambda)R(\lambda, A)R(\eta, A), \text{ and } R(\lambda, A)R(\eta, A) = R(\eta, A)R(\lambda, A),$
- 4. If moreover $(A, \mathcal{D}(A))$ is the infinitesimal generator of a c_0 -semigroup $\{S(t)\}_{t\geq 0}$ s.t. $\forall t\geq 0: \|S(t)\|_{\mathcal{L}(X)} \leq Me^{\omega t}$, then

$$\forall \lambda > \omega : \lambda \in \rho(A) \land R(\lambda, A) = \int_0^\infty e^{-\lambda t} S(t) \, \mathrm{d}t \land \|R(\lambda, A)\|_{\mathcal{L}(X)} \ge \frac{M}{\lambda - \omega}.$$

Remark. The point 4 says that under some conditions, the resolvent operator is the Laplace transformation of the semigroup operator.

Proof. Ad 1.:

$$AR(\lambda, A)x = (A - \lambda id) \underbrace{R(\lambda, A)}_{=(\lambda id - A)^{-1}} x + \lambda R(\lambda, A)x = \lambda R(\lambda, A)x - x.$$

Ad 2.: The same as 1.

Ad 3.:

$$R(\lambda, A) - R(\eta, A) = R(\lambda, A)(\mathrm{id} - (\lambda \mathrm{id} - A))R(\eta, A) = R(\lambda, A)(\eta \mathrm{id} - A - \lambda \mathrm{id} + A)R(\eta, A) = (\eta - \lambda)R(\lambda, A)R(\eta, A)$$

For $\lambda \neq \eta$ we also have

$$R(\lambda, A)R(\eta A) = \frac{R(\lambda, A) - R(\eta, A)}{\eta - \lambda} = \frac{R(\eta, A) - R(\lambda, A)}{\lambda - \eta} = R(\eta, A)R(\lambda, A).$$

Ad 4.: WLOG asume $\omega=0$, meaning $\|S(t)\|_{\mathcal{L}(X)}\leq M\,\forall t\geq 0$. Denote $\tilde{S}(t)=e^{-\omega t}S(t)$. Define

$$\tilde{R}x = \int_0^\infty e^{-\lambda t} S(t) x \, \mathrm{d}t.$$

First of all, this is well defined as

$$\|\tilde{R}x\|_X \le \int_0^\infty e^{-\lambda t} M \|x\|_X dT = \frac{M}{\lambda} \|x\|_X,$$

and so $\|\tilde{R}\|_{\mathcal{L}(X)} \leq \frac{M}{\lambda}, \tilde{R} \in \mathcal{L}(X)$. Next, we want to show

$$\forall x \in X : \tilde{R}x \in \mathcal{D}(A) \land A\tilde{R}x = \lambda \tilde{R}x - x \Leftrightarrow \mathrm{id} = (\lambda \mathrm{id} - A)\tilde{R}.$$

For $x \in X, h > 0$ fixed compute

$$\frac{1}{h} \left(S(h)\tilde{R}x - \tilde{R}x \right) = \frac{1}{h} \left(\int_0^\infty e^{-\lambda t} S(t+h)x - e^{-\lambda t} S(t)x \, \mathrm{d}t \right) =
= \frac{1}{h} \left(\int_h^\infty e^{-\lambda(t-h)} S(t)x \, \mathrm{d}t - \int_0^\infty e^{-\lambda t} S(t)x \, \mathrm{d}t \right) =
= \int_h^\infty \frac{e^{-\lambda(t-h)} - e^{-\lambda t}}{h} S(t)x \, \mathrm{d}t - \frac{1}{h} \int_0^h e^{-\lambda t} S(t)x \, \mathrm{d}t =
= e^{-\lambda t} \frac{e^{\lambda h} - 1}{h} \to \lambda e^{-\lambda t}, \text{ as } h \to 0_+$$

This implies

$$\chi_{(h,\infty)}(t)e^{-\lambda t}\frac{e^{h\lambda}-1}{h}S(t)x \to \lambda e^{-\lambda t}S(t)x \text{ on } (0,\infty) \text{ as } h \to 0_+.$$

The norm of this can be estimated as $\|\lambda e^{-\lambda t} S(t) x\| \le C e^{-\lambda t} M \|x\|_X \in L_1((0, \infty))$. Altogether, we obtain $\tilde{R}x \in \mathcal{D}(A) \wedge A\tilde{R}x = \lambda \tilde{R}x - x \Rightarrow (\lambda \mathrm{id} - A)\tilde{R}x = x$.

To proceed further, we need the following theorem:

$$x \in \mathcal{D}(A), A \operatorname{closed} : A\tilde{R}x = A\left(\int_0^\infty e^{-\lambda t} S(t)x \, \mathrm{d}t\right) = \int_0^\infty e^{-\lambda t} \underbrace{AS(t)}_{=S(t)A} x \, \mathrm{d}t = \tilde{R}Ax,$$

which has been stated but not proved ³⁷. Finally, we can write: $\forall x \in \mathcal{D}(A) : \tilde{R}(\lambda \mathrm{id} - A)x = x \Rightarrow \lambda \in \rho(A) \wedge \tilde{R} = R(\lambda, A)$. Moreover, we have also shown the mapping is a bijection.

Definition 21 (Contraction semigroup). We say that $\{S(t)\}_{t\geq 0}$ is a contraction semigroup if

$$\forall t \geq : ||S(t)||_{\mathcal{L}(X)} \leq 1.$$

 $^{^{37}}$ It could be shown by first constructing a approximating sequence of the Bochner integral, like a Riemann sum, do the calculation on this level and then pass to the limit.

Theorem 32 (Hille-Yosida). Let $M \ge 1, \omega \in \mathbb{R}$. A linear $(A, \mathcal{D}(A))$ on a Banach space X generates a c_0 -semigroup (meaning it is its infinitesimal generator) satysfing $\forall t \ge 0 : \|S(t)\|_{\mathcal{L}(X)} \le Me^{\omega t}$ if and only if

- 1. $(A, \mathcal{D}(A))$ is closed,
- 2. $\mathcal{D}(A)$ is dense in X,
- 3. $\forall \lambda > \omega, n \in \mathbb{N} : \lambda \in \rho(A) \wedge \|R^n(\lambda, A)\|_{\mathcal{L}(X)} \leq \frac{M}{(\lambda \omega)^n}$.

Proof. If $M=1, \omega=0$, then $\|R(\lambda,A)\|_{\mathcal{L}(X)} \leq \frac{1}{\lambda} \Rightarrow \|R^n(\lambda,A)\|_{\mathcal{L}(X)} \leq \frac{1}{\lambda^n}$. " \Rightarrow " has been proven, now show the other direction. The plan is to

- 1. approximate A by $\{A_n\} \subset \mathcal{L}(X)$,
- 2. construct S_n for A_n as previously,
- 3. estimate and limit passage.

Approximation: See the analogy: $a \in \mathbb{R} : \frac{n}{n-a} \to 1$, we would like $nR(n,A) \to id$. Calculate the norm of $nAR(n,A) = n(nR(n,A) - id) \in \mathcal{L}(X) \forall n \in \mathbb{N}$, (This approx. is called the Yosida approximation.) For $x \in \mathcal{D}(A)$ fixed:

$$||nR(n,A)x - x||_X = ||R(n,A)Ax||_X \le ||R(n,A)||_{\mathcal{L}(X)} ||Ax||_X \le \frac{1}{n} ||Ax||_X \to 0 \text{ as } n \to \infty.$$

If

$$y \in X: \|nR(n,A)y - y\|_{X} \le \|nR(n,A)(y - x)\|_{X} + \|nR(n,A)x - x\|_{X} + \|x - y\|_{X} \le 2\|y - x\| + \underbrace{\|nR(n,a)x - x\|_{X}}_{\rightarrow 0},$$

but $||y - x||_X$ can be made arbitrarily small from density of $\mathcal{D}(A)$ in X, so in fact

$$nR(n, A)y \rightarrow y \text{ in } X, \forall y \in X.$$

And so nR(n, A) really approximates id.

Using this gives us

$$\forall x \mathcal{D}(A) : A_n x = nAR(n, A)x = n \underbrace{R(n, A)}_{=R(n, A)A} x \to Ax \text{ in } X$$

pointwisely. Define now

$$S_n(t) = \sum_{k=0}^{\infty} \frac{(A_n t)^k}{k!} \in \mathcal{L}(X) \, \forall t > 0,$$

which has a norm

$$||S_n(t)||_{\mathcal{L}(X)} \le \left\| \sum_{k=0}^{\infty} \frac{1}{k!} (tA_n)^k \right\|_{\mathcal{L}(X)} = \left\| \sum_{k=0}^{\infty} \frac{1}{k!} (-ntid + n^2 tR(n, A))^k \right\|_{\mathcal{L}(X)}$$

and we claim this is equal to

$$= \left\| \sum_{k=0}^{\infty} \frac{1}{k!} (-ntid)^k \sum_{k=0}^{\infty} \frac{\left(n^2 t R(n,A)\right)^k}{k!} \right\|_{\mathcal{L}(X)},$$

which follows from the Cauchy theorem on products of series. Estimating this gives $\leq e^{-nt}$ id $\sum_{k=0}^{\infty} \frac{(nt)^k}{k!} \|nR(n,A)\|_X^k \leq e^{-nt}e^nt = 1$, as $\|nR(n,A)\|^k \leq 1$. This means $\{S_n(t)\}_{\mathcal{L}(X)} \leq 1$.

Now show that this converges: fix $x \in \mathcal{D}(A)$, compute

$$||S_{n}(t)x - S_{m}(t)x||_{X} = \left\| \int_{0}^{t} \frac{d}{ds} (S_{n}(s)S(m)(t-s)x) ds \right\|_{X} = \left\| \int_{0}^{t} S_{n}(s)(A_{n} - A_{m})S_{m}(t-s)x ds \right\|_{X} \le \int_{0}^{t} t ||A_{n} - A_{m}|x||_{X} \Rightarrow \{S_{n}(t)x\} \text{ is Cauchy },$$

and since X is Banach, it is convergent also. Finally, for $y \in X$, we have

$$||S_n(t)y - S_m(t)y||_X \le ||S_n(t)(y - x)||_X + ||S_n(t)x - S_m(t)x||_X + ||S_m(x - y)||_X \le 2||x - y||_X + t||(A_n - A_m)x||_X.$$

We claim that $\{S_n(t)y\}$ is Cauchy uniformly on $[0,T], T>0 \Rightarrow \exists S(t): S_n(t)y \to S(t)y \forall y \in X, t>0$. And using Banach-Steinhaus (princip stejnoměrné omezenosti) we obtain $\{S(t)\}_{t\geq 0}$ is a c_0 -semigroup.

It remains to answer this question. Is $(A, \mathcal{D}(A))$ the infinitesimal generator of $\{S(t)\}_{t\geq 0}$? Let $(\tilde{A}, \mathcal{D}(\tilde{A}))$ be the infinitesimal generator of $\{S(t)\}_{t\geq 0}$. Compute

$$S_n(t)x - x = \int_0^t \frac{\mathrm{d}}{\mathrm{d}s} S_n(s)x \, \mathrm{d}s = \int_0^t S_n(x) A_n x \, \mathrm{d}s,$$

realize that

$$||S_n(t)A_nx - S(s)Ax||_{Y} \le ||S_n(s)(A_n - A)x||_{Y} + ||S_n(s) - S(s)Ax||_{Y} \to 0,$$

from the previously shown convergences, and so (we have taken the limit of the LHS also)

$$S(t)x - x = \int_0^t S(s)Ax \, ds.$$

This allows us to compute

$$\forall x \in \mathcal{D}(A) : \lim_{t \to 0_+} \frac{S(t)x - x}{t} = Ax \Rightarrow \mathcal{D}(A) \subset \mathcal{D}(\tilde{A} \land A = \tilde{A} \text{ on } \mathcal{D}(A).$$

The opposite inclusion is simple: fix $\lambda > 0$: $\lambda \in \rho(A) \cap \rho(\tilde{A})$, and so $\lambda \operatorname{id} - A : \mathcal{D}(A) \to X$ is onto, but also $\lambda \operatorname{id} - A = \lambda \operatorname{id} - \tilde{A}$ on $\mathcal{D}(A)$, and so $\lambda \operatorname{id} - \tilde{A} : \mathcal{D}(A) \to X$ is onto. From the previous theorem, we know $\lambda \operatorname{id} - \tilde{A}$ is one-to-one, so $\mathcal{D}(\tilde{A}) = \mathcal{D}(A)$. Altogether, $A = \tilde{A}, \mathcal{D}(A) = \mathcal{D}(\tilde{A})$.

8 (Some) exercises

$8.1 \quad 4.3.2025$

Example (Coefficients for smooth extension). Define

$$Eu(x', x_d) = u(x', x_d), x \ge 0, = \sum_{j=1}^{k+1} u(x', -\frac{x_d}{j})c_j, x_d < 0.$$

for $u \in \mathcal{D}(\mathbb{R}^d)$. Find $\{c_j\}_{j=1}^{k=1}$ in such a way that $Eu \in C^k(\mathbb{R}^d)$. Moreover, take d = 1.

Proof. For k = 0, j = 1 we take $c_1 = 1, c_j = 0, j \neq 1$. For k = 1, compute the derivative:

$$\partial_{d^n} Eu(x', x_d) = \partial_{d^n} u(x', x_d), x_d \ge 0, = \sum_{j=1}^{k-1} (-1)^n \frac{\partial_{d^n} u(x', \frac{x_d}{j})}{j^n} c_j, x_d < 0.$$

If we take $x_d = 0$ in particular:

$$\partial_{d^n} u(x',0) = \sum_{j=1}^{k+1} \partial_{d^n} u(x',0) \left(-\frac{1}{j}\right)^n c_j \Leftrightarrow 1 = \sum_{j=1}^{k+1} c_j \left(-\frac{1}{j}\right)^n, \forall n \in \{0,\ldots,k\}.$$

That is a linear system of k + 1 equations. Is it solvable?

8.2 8.4.2025

Example (Laplace). Let $a_0 = 0, a(\cdot, z, p) = p$. Then $|a(\dots)| \le |p|$, growth can be accomplished for $r = 2, a(\dots) \cdot p \ge |p|^2$. We can thus apply the theorem to our laplace equation

Example. Let $a_0 = 0$, $a(\cdot, z, p) = p \arctan(1 + |p|^2)$. Then it is clearly Caratheodory, it is bounded $|a(\dots)| \le |p| \frac{\pi}{2}$, so the growth conditions yield, it is coercive as $\arctan(1 + |p|^2) \ge \frac{\pi}{4}|p|^2$, and it is monotone

$$\left(\operatorname{atan}\left(1+|p_1|^2\right)p_1-\operatorname{atan}\left(1+|p_2|^2\right)p_2\right)(p_1-p_2)=\int_0^1\sum_{j=1}^d\frac{\mathrm{d}}{\mathrm{d}s}\operatorname{atan}\left(1+|p_2+s(p_1-p_2)|^2\right)(p_2+s(p_1-p_2))\,\mathrm{d}s\,(p_1-p_2)_j$$
